Appendix A Updated Criticality Assessment

Client: City of Newport

To: Andrew Grant, Wastewater Treatment Supervisor

From: Mark Walter, Waterdude Solutions

Date: October 11, 2021

1. Introduction and Scope of Technical Memorandum

This technical memorandum (TM) provides an update to the Wastewater Treatment Facilities Condition Assessment dated January 2017. The information in this TM includes the following:

- Description of the 2021 condition assessment update.
- A summary of wastewater treatment facilities systems current condition.
- Tabulated results from the condition assessment and criticality matrix update.
- Observations based on the results of the update.

2. 2021 Condition Assessment Update

Workshops were conducted September 27 and 28, 2021 to update system condition ratings and the criticality matrix. The systems rating spreadsheet used for the 2017 assessment was used as a condition baseline. The system ratings spreadsheet includes nineteen systems reflecting the entire WWTP facility. Key components of each system are rated and tabulated for a system score. The condition rating scale used for the assessment is shown as Table 1. This condition assessment update is intended to support facility planning and prioritization of improvements.

The criticality matrix developed in March 2018 was reviewed and updated. The criticality matrix measures impact including health and safety, compliance, reliability, disruption, ability to return to service and financial.

The likelihood and trigger matrix further defines system characteristics by placing values on:

- Condition assessment overall
- Effective operating protocols
- Reliability
- Planned redundancy
- Capacity and utilization
- Obsolescence
- Annual maintenance cost

The two matrices are combined and tabulated to provide an overall system risk score. These tables and the final criticality risk matrix are included as <u>Appendix A</u>.

GRADE	CONDITION	DESCRIPTION
0	Abandoned	Asset Abandoned, not longer in use, or no longer exists
		Sound physical condition. Meets current needs. Operative and well maintained. Asset
1	Very Good	expected to perform adequately with routine maintenance for 10 yr. or more. No
		work required.
		Acceptable physical condition. Shows minor wear that has minimal impact on
2	Good	performance. Minimal short term failure risk. Potential for deterioration or impaired
		performance over next 5-10 years. Minor work (if any) required.
		Functionally sound but showing wear and diminished performance. Moderate short
3	Fair	term failure risk. Potential for further deterioration and diminished performance
5	Fall	within next 5 years. Renewal or major component replacement expected within next
		5 years. Minor work required but asset is serviceable.
		Asset functions but required high level of maintenance to remain operable. High risk
4	Door	of short term failure. Likely to have significant deterioration in performance within
4	Poor	next two years. Renewal or replacement expected within next 2 years. Substantial
		work required, asset barely serviceable.
		Asset failed or failure is imminent. Excessive maintenance required. No further
5	Very Poor	service life expectancy. Significant health and safety hazer. Major work or
		replacement is urgent.

Asset Condition Assessment Rating Scale

Table 1

3. Systems Condition Summary

The overall average condition of all wastewater treatment systems has decreased from Good-Fair to Fair. This reduction in condition rating is primarily due to acquiring additional time in service creating component wear. As the facilities near 20 years in service, obsolescence is affecting the ability to acquire parts and service.

Numerous refurbishment and replacement projects have been completed since 2018. These projects focused on replacing failed system components and replacement of some previously abandoned systems including:

- Various pump refurbishment and replacements
- New chlorine residual analyzer at the chlorine contact basin
- Refurbishment and optimization of the aerators
- Centrifuge refurbishment
- Centrifuge controls replacement
- Repairs of the solids pasteurization system

Several projects are funded and scheduled for 2021 including:

- Replacement and optimization of the disinfection system
- Continued optimization of aerators
- Clarifier drive and mechanism refurbishment
- Solids conveyor belt replacement

While these projects help maintain the wastewater system's design level of service, obsolescence and age continue to challenge system performance and reliability.

The criticality matrix was updated to aid with this effort. Table 2 incorporates the overall condition rating, risk score and critically rank to aid with evaluation and prioritization of improvements.

System Description	Risk Rank	Overall Condition Rating	Criticality Rank
Pasteurization System Biosolids	1	3.4	1
Septage	2	3.6	9
Centrifuge	3	3.2	5
Northside Pump Station	4	3.1	4
Headworks Screenings	5	3.7	10
Sodium Hypochlorite System	6	3.3	2
Pasteurization System Lime Storage and Feed	7	3.4	3
Aeration Basin	8	2.7	14
RAS/WAS Pumping	9	2.4	11
Influent Pump Station	10	3.0	7
Secondary Clarification	11	2.3	12
Electrical	12	2.3	8
Sludge Storage and Dewatering Feed Pumping	13	2.1	17
Generator Power	14	2.0	6
Instrumentation and Control	15	Not Rated	15
Plant Drain	16	2.0	19
Dewatering Polymer	17	2.2	18
Plant Effluent	18	1.8	16
Effluent Conveyance	19	2.2	13
W3 and Sump Pumping	20	3.0	19
Structures	21	1.9	21
W1	22	2.4	22

Table 2

The risk rank provides a means of identifying the systems that pose the highest risk to the facility. The corresponding overall condition rating provides a separate score to compare with the risk rank. The criticality rank provides an additional reference point. This information provides the city with different perspectives when developing plans for these facilities.

The systems most at risk include four main areas:

- Northside pump station
- Headworks
- Septage
- Solids handling

Key findings in each of these systems is summarized as follows.

Northside Pump Station

The northside pump station is a remote pump station located at the site of the original wastewater treatment facility. Failure of the station results in sewage overflow as well as potential overflow of the Nye Beach pump station. The station provides pretreatment including screening and grit removal. These systems and the structure that houses these systems are in Fair to Poor condition. During 2019 and 2020 staff engaged consultants to develop improvement options. Implementation of improvement options are pending.

The condition of the station continues to challenge ongoing operation and maintenance of the station. One example is the screening system. The system is quickly reaching the end of its service life and requires continuous maintenance to maintain operation. The package screening and conveyance unit has been repaired several times and continues to degrade. Figure 1 shows how the conveyor has begun to wear through the housing creating leakage from the unit.

Figure 1

The equipment in the station is exposed to weather due to the failure of the geodesic dome that serves as the roof. Numerous leaks create operational challenges and requires staff to cover equipment with plastic for protection. Figure 2 shows the screening controls that must be covered to preserve electrical control.

Headworks

The headworks is located at the treatment plant site and includes screening and sampling. The screening system is the same as northside pump station. In addition to having the same maintenance challenges, the headworks is exposed to high levels of hydrogen sulfide. This exposure results in severe corrosion throughout the system. The sampling and air handing equipment requires replacement on a regular basis due to this corrosion. The sampling system is currently out of service due to this condition. Staff have implemented an interim sampling solution that requires addition of ice to maintain the required temperature to preserve sample integrity.

Corrosion is damaging infrastructure throughout the conveyance system, from the northside pump station to the influent pump station and into the headworks. The septic conditions that produce hydrogen sulfide also creates an oxygen demand on the secondary treatment system which strains the aeration system at times. High levels of hydrogen sulfide gas create hazardous atmospheres that are toxic. Figure 3 shows the effect of hydrogen sulfide on concrete. This photo was taken in front of the influent pump station where air is removed from the wet well for treatment. The concrete is eroding due to sulfuric acid created by hydrogen sulfide and moisture.

Septage Receiving

Septage receiving is an ongoing activity at the treatment plant as septage haulers from the region arrive on a regular basis to off load septage. The package receiving system includes automated control and screening. The screening system is like the northside and headworks systems. The seepage screen is no longer performing and requires manual removal of screening. This requires the haulers or staff to intervene between loads to remove debris from the screen.

Solids Handling

The overall condition of the solids handling system is Fair to Poor even after several component refurbishments over the past three years. Much of the condition deterioration is due to the fact the system must operate well over 40 hours a week to process the incoming solids. This leaves little time for maintenance and results in immediate impact when a component failure occurs. The system's automation incorporates multiple systems. While many controls have been refurbished, the incomplete integration caused by failures over the years has resulted in manual control and monitoring. Operation of the system requires in excess of one full time equivalent employee resource.

2018 to 2021 Condition Rating Comparison and Observations

This section concludes the condition assessment update TM. Table 3 provides a summary and comparison of 2018 and 2021 ratings. Rating changes that result in negative values indicate further deterioration in asset condition. An observations column has been added to provide context to the rating change.

Observations based on the comparison of the two condition assessments:

- The system condition ratings from 2018 to 2021 have degraded by about 6% even though several refurbishment projects have been completed in that time.
- Approximately half of the systems show declining condition.
- Refurbishments of the aeration and polymer systems have resulted in an improved condition score.
- Pump failures in IPS, RAS/WAS, NS pump station contribute to a decreased rating.
- Personnel safety in the areas of the NS pump station, headworks and septage systems contribute to reduced condition rating.
- The condition of the solids handling systems combined (pasteurization system, centrifuge, lime feed and septage receiving) pose a significant risk to the city.

System Description	2018 Condition Rating	2021 Condition Rating	Rating Change	Observation
_				
Influent Pump Station	3.2	3.0	0.20	Pump improvements; Odor system in service; Wet well and equipment corrosion increasing.
Effluent Conveyance	2.2	2.2	0.00	Planned to install chlorine residual monitoring.
Headworks Screenings	3.0	3.7	-0.71	Pump out of service; Screening ineffective; Screening chute safety; Corrosion.
Aeration Basin	2.9	2.7	0.22	New aerator drives, bearings, lubrication; Increased RPM to provide additional aeration.
Secondary Clarification	2.0	2.3	-0.33	Drive and mechanism deterioration, refurbishment scheduled for 2022. New scum pump installed.
Sodium Hypochlorite System	2.5	3.3	-0.79	Chemical metering and control not reliable. New skid mounted system design is 80% complete.
W3 and Sump Pumping	2.6	3.0	-0.40	Sump pumps not accessible for maintenance, requires cutting pipe.
				New access deck installed; screening removal requires manual effort; Monitoring sensors not
Septage	2.9	3.6	-0.67	in operation.
Plant Drain	2.4	2.0	0.40	Replaced plant drain pump.
Plant Effluent	2.4	1.8	0.57	Replaced sample pump; New chlorine analyzer; Purchased new mixer and control panel.
W1	2.1	2.4	-0.28	Pump condition decreased to fair.
Generator Power	2.0	2.0	0.00	Serviced and load tested July 2021.
RAS/WAS Pumping	1.4	2.4	-1.04	One RAS pump out of service; WAS flow metering not accurate.
Sludge Storage and Dewatering Feed Pumping	1.9	2.1	-0.16	Blower not operating at design pressure.
Dewatering Polymer	3.4	2.2	1.20	Replaced one of two polymer make down systems.
Centrifuge	3.7	3.2	0.55	One centrifuge out of service due to feed port; New centrifuge motors, controls; New screw conveyor for No. 1 centrifuge. Both centrifuges on line do not meet throughput needs.
Pasteurization System Lime Storage and Feed	2.8	3.4	-0.64	Equipment on top of lime storage not accessible due to safety. Other equipment requires excessive maintenance.
Pasteurization System Biosolids	2.6	3.4	-0.80	Control requires manual operation; Heat system not reliable; conveyor replacement scheduled for December 2021.
	2.0	5.4	-0.80	One of three pumps out of service for repair; Screens are worn and not effective in removing
Northside Pump Station	2.5	3.1	-0.64	screenings.
	2.5	5.1	0.04	Perimeter fence project completed; Northside pump station cover has missing panel, broken
Structures	1.9	1.9	0.03	skylights and corrosion.
Electrical	2.5	2.3		Harmonic filters not serviceable; Several adjustable frequency drives have been replaced.
Instrumentation and Control	Not Rated	2.5 n/a	n/a	n/a

Table 3

Criticality Matrix

Wastewater Treat	ment -	· criticality levels by pos	sible impact		
Impact Category	Weight	Negligible = 1	Low = 4	Moderate = 7	Critical = 10
Health & Safety of 1 employees and public	1.0	No injuries or adverse health effects	No lost-time injuries or medical attention necessary	Lost time injury or injury requires medical attention	Long term disability or death.
2 Compliance with permits and regulations	0.8	No volations of permits or regulations. No environmental or public health impact.	Warning Letter but no enforcement action taken, No environmental or public health impact	Violation of NPDES Permit. Possible short-term environmental impact. Possible public health impact.	Violation of NPDES Permit. Enforcement action likely. Long- term environmental impact likely, public health impact likely.
3 Service reliability	0.8	<20 services interrupted; No Process Impact	<500 services effected; Reduction in Process efficiency	500-1000 services effected; Long term Process impacts	Service interruption >1000 services; Process failure
4 Disruption to the community / Public Image	0.7	No social or economic impact on the businesses or the community. No disruption to the community. No media coverage	No social or economic impact on the businesses or the community. Minor disruption to the community (e.g., traffic, dust, noise). No media coverage.	residential customers and/or a few	Long-term or area-wide economic impact on numerous businesses or any "high-priority" customer. Major disruption to the community (e.g., traffic, dust, noise). National media coverage.
5 Ability to return asset to service	0.7	Less than 4 hours	Service restored 4 to 12 hours	Service restored 12 to 24 hours	Not able to restore service for >24 hrs
6 Financial impact on utility	0.6	<\$5,000	\$5,000 to \$25,000	\$25,000 to \$150,000	>\$150,000

Likelihood-Trigger Matrix

Li	ikelihood - Tri	gger M	atrix

Class A Compost Life Cycle Costs

Cost Element

	Annual O&M
Operations and Maintenance Present Worth C	Cost
Hauled Waste	(\$80,000)
Thickening	\$70,000
Aerobic Digester	\$80,000
Dewatering	\$110,000
Compost	\$180,000
O&M Present Worth Cost Subtotal	\$360,000

Hauled Waste

Item	Annual Costs ^(a)	
Labor ^(b)	\$9,400	
Electricity ^(c)	\$400	
Equipment Maintenance ^(d)	\$9,900	
Hauled Waste Revenue ^(e)	(\$100,000)	
Total Annual Costs	(\$80,300)	
Notes:		

Notes:

(a) Costs are rounded to the nearest \$100

(b) Costs assume burden rate of \$50 per hour

(c) Costs assume \$0.08 per kW-hr

(d) Costs are annualized at 2% of equipment costs.

(e) Based on 2021 and 2022 hauled waste revenues, provided by the City via email dated 13 January 2023.

Labor

Item	Task	Frequency Hours	Annual Total	
Hauled Waste	Startup	4xweek	1	52
	Shutdown	4xweek	1	52
	Gen. Maintenance	4xweek	1	52

Appendix E Centrifuge Replacement TM

23 September 2022

Draft Technical Memorandum

То:	Josh Johnson, Brown & Caldwell		
From:	Ben Bosse, Kennedy Jenks Mark Cullington, Kennedy Jenks		
Reviewed By: Shawn Spargo, Kennedy Jenks			
Subject:	Centrifuge Replacement Evaluation Newport WWT Master Plan – Phase II, Brown & Caldwell Project No. 158211 City of Newport K/J Project No. 2276008*00		

Introduction

The City of Newport (City) owns and operates the Vance Avery Wastewater Treatment Plant (WWTP) constructed in 2002 and located in South Beach, Oregon. The WWTP is an activated sludge plant with a peak wet weather capacity of 15 million gallons per day (mgd) that currently receives an average annual flow of approximately 2 mgd. In 2022, the City authorized Brown & Caldwell (BC) to perform master planning for the WWTP. BC has subcontracted with Kennedy/Jenks Consultants (Kennedy Jenks) in an agreement dated 11 March 2022 to complete a Centrifuge Replacement Evaluation for replacement of the existing dewatering centrifuges. The existing centrifuges were identified in a 2018 BC capacity assessment as undersized to support current biosolids production rates and are reaching the end of their useful life.

The purpose of this Technical Memorandum (TM) is to present an evaluation for replacement of the existing dewatering centrifuges. The evaluation includes layouts of larger centrifuges to accommodate the projected solids loadings over a 20-year design period. The evaluation also includes replacement of the existing liquid emulsion polymer system, controls, conveyors, dewatering feed pumps, and electrical considerations. The evaluation makes a recommendation on new equipment sizing and presents capital, Operations and Maintenance (O&M) costs, and life-cycle costs for the recommended improvements.

Existing Conditions

The WWTP operates two Alfa Laval/Sharples dewatering centrifuges. Centrifuge 1 was installed between 1994 and 1996, and Centrifuge 2 was installed in 2001. Both centrifuges were re-built by CentriTEK in 2018 and 2019, including replacement of damaged scroll tiles, bearings and seals, cleaning and painting, and alignment and balancing.

The centrifuges receive Waste Activated Sludge (WAS), scum, and hauled waste conveyed from the sludge storage tank by two Wemco dewatering feed pumps.

Josh Johnson, Brown & Caldwell 23 September 2022 BC Project No. 158211 Page 2

Plant staff typically operate centrifuges 8 to 10 hours per day, and currently are forced to operate centrifuges beyond capacity to maintain operations. The dewatering feed solids concentration averages approximately 0.6 % Total Solids (TS). The dilute feed concentration is a result of an undersized storage tank that inhibits an effective decant and thickening of solids upstream of dewatering. The stated design capacity of the centrifuges is 65 gallons per minute (gpm); however, plant staff routinely feed centrifuges at a rate of 90 gpm.

A summary of existing plant operating data for centrifuges is included as Table 1. Design data for the existing centrifuges are summarized in Table 2. Centrifuge 1 is shown on Figure 1.

Projected Solids Loadings

The 20-year solids loading projections to dewatering were provided to centrifuge manufacturers for sizing and selection of new centrifuge equipment. Projected solids loadings were presented in the draft Basis of Design TM dated 1 July 2022, and are included in Table 3 for reference. Sizing of dewatering equipment is based on the 2040 maximum week loadings, as described in the draft Solids Basis of Design TM prepared by Kennedy Jenks on 1 July 2022. Maximum day loadings are not evaluated due to the storage provided by the upstream storage tank.

Table 3: Projected Dewatering Loadings

Notes:

(a) Based on maximum week WAS solids loading peaking factor of 1.5, per BC.

(b) Flows and loads values were developed by BC and provided via email dated 10 May 2022.

(c) gpd = gallons per day.

(d) Based on an average solids concentration of 0.55% per BC.

(e) 2022 average hauled waste flows and loads are based on WWTP annual biosolids reports (2018 through 2021) and an average solids concentration of 1.8%. Year 2040 hauled waste flows and loads are based on WAS peaking factors.
 (f) Assumes a decant rate of 20% of influent to storage tank.

(g) Assumes a decant solids concentration of 0.11%, based on plant operating data for December 2021.

(h) Based on continuous feed to dewatering.

Manufacturer Proposals

Proposals for centrifuge replacement were obtained from two manufacturers: Andritz and Centrisys. Proposals were obtained from multiple manufacturers to understand the size, configuration, layout, and maintenance clearances required for equipment replacement. Additional manufacturers and proposals may be considered as the project moves into the

Josh Johnson, Brown & Caldwell 23 September 2022 BC Project No. 158211 Page 5

design phase. Projected operating data and initial manufacturer equipment selections are summarized in Table 4.

Table 4: Dewatering Operating Characteristics

Values

Notes:

(a) 2040 maximum week solids loading to dewatering, as presented in the Draft Basis of Design TM dated 1 July 2022.

(b) Based on a Storage Tank decant rate of 20% of influent flows.

(c) Based on continuous operation, 24 hours per day 7 days per week.

(d) Based on Andritz laboratory test results dated 26 May 2022, included in Attachment A.

(e) City's stated maximum operating days per week based on staffing availability.

(f) Redundancy expressed as a percentage of operating hours per 24-hour period. 100% represents full n+1 redundancy.

Three operating scenarios were provided to the manufacturers to select equipment of various sizes. The number of duty centrifuges and operating hours were varied to determine the largest process capacity centrifuge(s) that would fit within the existing centrifuge process area. A review of the general arrangement drawings for Scenario 3, Andritz D6LX and Centrisys CS26-4, indicated that the equipment footprints for both manufacturers were too large to fit within the existing centrifuge process area. As a result, Scenario 3 was eliminated from consideration. Scenario 2 selections from each manufacturer, Andritz D5L and Centrisys CS21-4HC, were

Josh Johnson, Brown & Caldwell 23 September 2022 BC Project No. 158211 Page 6

found to each fit within the existing centrifuges replacement area. Based on preliminary discussions with the City, preference is to provide larger units with additional redundancy. As a result, the Scenario 1 selections from each manufacturer, Andritz D4L and Centrisys CS18-4, are not considered. A discussion of the physical constraints and considerations for each manufacturer selection is presented later in this TM. Proposal data for the Andritz and Centrisys selections are summarized in Tables 5 and 6, respectively.

Andritz – Scenario 2

The Andritz D5L centrifuges include 2304 duplex stainless steel solids bowls, 316 stainless steel scroll with tungsten carbide tiles over the full length, 316 stainless steel wetted parts, carbon steel frame with epoxy coating, and FRP casing covers and drive guards. Flexible connectors are provided to convey solids discharge to inclined screw conveyors positioned below the centrifuges. Included with the Andritz proposal are two incline screw conveyors to transport dewatered solids from the solids discharge flange to the existing dewatering belt conveyor.

The Andritz proposal includes galvanized steel centrifuge stands positioning centrifuges approximately 3'-6" above the floor. At this height, maintenance platforms are not anticipated to be required. Flexible connectors to transition from the rectangular centrate discharge flange to an 8-inch-diameter centrate discharge pipe are also included.

Andritz also provides a 316 stainless steel pipe manifold on each unit for the connection of feed sludge, polymer, and wash water process connections fitted with flexible connectors. The Andritz centrifuges have manually greased bearings with an L-10 life of 100,000 hours. Centrate piping would require venting to prevent air lock. Total connected horsepower for the D5L is 190 hp for two centrifuges.

Lead time for the Andritz D5L is 6 weeks for shop drawings and 40 weeks from approved drawings. A figure of the Andritz D5L is shown on Figure 2. The Andritz D5L proposal is included with this TM as Attachment A, including drawings, equipment data, and installation list. Andritz performed sludge testing in May 2022, and the results are also included in Attachment A.

Figure 2: Andritz D5L

Centrisys – Scenario 2

The Centrisys CS214HC centrifuges include duplex stainless steel solids bowls, duplex stainless steel scroll shaft and 304 stainless steel flights, and 304 stainless steel wetted parts and powder coated carbon steel frame. Flexible connectors are provided to convey solids discharge to inclined screw conveyors positioned below the centrifuges. Included with the

Josh Johnson, Brown & Caldwell 23 September 2022 BC Project No. 158211 Page 9

Centrisys proposal are two incline screw conveyors to transport dewatered solids from the solids discharge flange to the existing dewatering belt conveyor.

The Centrisys proposal includes powder coated carbon steel stands positioning centrifuges approximately 3'-6" above the floor. Maintenance platforms are not anticipated to be required. Centrisys centrifuges include an automatic grease lubrication system incorporating low grease level sensors.

The Centrisys centrifuges also incorporate a standalone hydraulic back drive that powers the scroll. The hydraulic drive is a distinguishing component of the Centrisys proposal. Centrisys states that the hydraulic drive is more efficient and contains fewer moving parts than a gearbox. Total connected horsepower for the CS21-4HC is 180 hp for two centrifuges. The Centrisys proposal also includes an extended 15-year scroll warranty, and a power run-through option that allows the centrifuge to continue to drive the scroll for a limited time in the event of a power outage. This feature allows the centrifuge to discharge its contents before completely shutting down; however, additional investigation would be needed to verify whether this option can be implemented, including determining if solids conveyors and the RDP lime pasteurization process are currently on standby power or have the physical capacity to accept the volume of solids discharged during an outage.

Lead time for the Centrisys CS21-4HC is 6 weeks for shop drawings and 50 weeks from approved drawings. A figure of the Centrisys CS21-4HC is shown on Figure 3. The Centrisys CS21-4HC proposal is included with this TM as Attachment B, including drawings, equipment data, and installation list.

Figure 3: Centrisys CS21-4HC

Equipment Layouts

General arrangement drawings were provided by the centrifuge manufacturers and preliminary layouts were developed for each model to understand how centrifuges could be installed in the existing dewatering process area. Equipment layouts for Andritz and Centrisys for Scenario 2 are shown on Figures 4 and 5, respectively.

Josh Johnson, Brown & Caldwell 23 September 2022 BC Project No. 158211 Page 10

Figure 4: Scenario 2 Andritz D5L Equipment Plan

Figure 5: Scenario 2 Centrisys CS21-4HC Equipment Plan

Josh Johnson, Brown & Caldwell 23 September 2022 BC Project No. 158211 Page 11

Physical Considerations

An existing 2-ton bridge crane is located in the dewatering process area. Field measurements provided by the City indicate a maximum hook height of approximately 12 feet for removing components from the centrifuge frame when performing maintenance. A single roll-door to the dewatering area is located on the east side of the Solids Handling Building for egress of equipment. An equipment laydown area immediately west of the dewatering polymer area is provided for transport of centrifuge components. This area also contains a hatch to the lower pump gallery for the removal of equipment from the basement level and must remain clear.

The centrifuge replacement project anticipates that the existing dewatering belt conveyor which conveys dewatered solids to the RDP lime pasteurization process remains; however, modifications to the height of the belt conveyor may be required based on the geometry of the inclined screw conveyors and position of the centrifuges within the room. Initial City field measurements indicate that the existing stainless steel supports beneath the dewatering belt conveyor may be able to be cut down to lower the belt conveyor up to 12 inches if needed. If lowered, additional investigation would be required to coordinate the modified belt conveyor with the existing RDP conveyors. Discharge chutes would be provided at the incline screw conveyor discharge to guide solids to the belt surface.

Additionally, centrifuges and supporting equipment will need to be located within the lift boundary of the existing bridge crane, as shown on Figures 4 and 5. Housekeeping equipment pads would be provided under each centrifuge to facilitate room washdown.

Andritz

Physical data for the Andritz D5L centrifuges, along with maintenance clearances, lifting heights, and component weights, are summarized in Table 7.

In addition to placing centrifuge equipment within the bridge lift boundary and observing manufacturer recommendations for maintenance clearances around the units, the height of the existing dewatering belt conveyor is a controlling factor in determining the position of centrifuges within the process area. The recommended maximum incline of the screw conveyors is between 25 and 30 degrees. To position the screw conveyor discharges sufficiently above the dewatering belt conveyor will require a minimum horizontal distance of 6'-6" from centerline of the centrifuge to the centerline of the belt conveyor. This layout assumes that centrifuges are installed on stands anchored to the concrete floor, with a stand height of 3'-6". An example section drawing of this configuration from another project is shown on Figure 6.

Process connections, such as feed and wash water, would be routed through the floor slab from the basement level below where piping is suspended from the ceiling/floor slab. Additionally, vent piping would need to be routed from the centrifuges to an air handling facility to dispose of foul air and to meet the electrical classification requirements of NFPA 820 for solids processing rooms.

Weight, Ibs ^(a)	3,700
Minimum Hook Height, inches	102
Main Drive	
Weight, Ibs ^(b)	847
Notes:	

Table 8: Centrisys CS21-4HC Physical Data

(a) Weight when empty. The scroll cannot be removed independently from the rotating assembly.

(b) To be determined by Centrisys.

Similar to the Andritz discussion, Centrisys centrifuges will need to fit within the existing constraints of the dewatering process area. The layout shown on Figure 5 includes an overlap of the scroll removal clearance for Centrifuge 2 and the inclined screw conveyor for Centrifuge 1. A preliminary review of the inclined screw conveyor elevation at this point indicates approximately 24 inch clearance between the top of the inclined screw conveyor and bottom of the scroll of Centrifuge 2 when removed.

Electrical Considerations

The existing centrifuges are powered from 60MCC1 and 60MCC2, located in the electrical room on the ground level of the Solids Handling Building, immediately west of the dewatering process area. Centrifuge 1 is powered from 60MCC1, and Centrifuge 2 is powered from 60MCC2. 150A circuit breakers control power fed to control panels located in the control room that house 40 hp (main drive) and 10 hp (back drive) variable frequency drives (VFDs). A partial single line diagram for 60MCC1 is shown on Figure 7, depicting both the existing conditions and proposed

Josh Johnson, Brown & Caldwell 23 September 2022 BC Project No. 158211 Page 14

load increases associated with the Andritz and Centrisys selections. Modifications to the 60MCC2 single line diagram are similar.

Figure 7: Partial 60MCC1 Single Line

A preliminary load evaluation of the motor control centers (MCCs) indicates that the existing equipment and feed breakers are sufficiently sized to accommodate the increased loads shown on Figure 7. A preliminary review of record drawings for 60SWGR1 indicate that the existing switchgear may be overloaded as it is. Additional investigation is recommended to determine if the Centrifuge Replacement Evaluation may trigger electrical improvements to 60SWGR1.

MCCs 60MCC1 and 60MCC2 are likely reaching the end of their service life, and replacement parts may become increasingly difficult to procure. We recommend the City consider MCC replacement with the Centrifuge Replacement Evaluation. If the City has not experienced maintenance issues with the existing MCCs their replacement could be deferred. The City may be considering a plant-wide electrical conditions assessment in the near future that will help to address these questions.

It is assumed that the Solids Handling Building is ventilated at a rate greater than 6 air changes per hour; however, this is unknown and will need to be verified. Per NFPA 820, the dewatering process area is then considered to be unclassified. Explosion proof motors, enclosures, and electrical connections have not been included with the manufacturers proposals.

Josh Johnson, Brown & Caldwell 23 September 2022 BC Project No. 158211 Page 15

Controls

The existing centrifuge control panels, shown on Figure 8, are located in the Control Room west of the dewatering process area. The control panels house VFDs, programmable logic controller (PLCs) and human machine interfaces (HMIs) for the operation of centrifuges, and include hardwire I/O. Existing PLCs are Allen-Bradley with SLC 500 processors. The City made programming improvements in 2017 to address issues with the automatic operation of centrifuges; however, it was determined that further control upgrades were recommended to provide integration with the plant's SCADA system and interlocks with support equipment such as dewatering feed pumps, polymer system, conveyors, and the RDP lime pasteurization process. Plant staff have indicated a preference for centrifuge manufacturers to provide new control panels with ethernet I/O that will support integration with the various support equipment and provide unit responsibility over these systems.

Andritz

Andritz provides a NEMA 4X junction box mounted to each centrifuge frame, along with bearing temperature sensors, vibration sensors, bowl speed sensors, and wash water solenoid valves. Two NEMA 12 starter panels equipped with fans and filters would be provided and are anticipated to be installed in the existing dewatering control room. Starter panels include Allen-Bradley PowerFlex 755 VFDs for the main and back drives. Two stainless steel NEMA 4X centrifuge control panels are provided, equipped with air conditioners. Control panels include Allen-Bradley CompactLogix PLCs with ethernet capability, 10-inch PanelView Plus HMI screens, and E-stops.

Centrisys

Centrisys provides air conditioned, 304 stainless steel NEMA 4X control panels for each centrifuge that houses the main circuit breaker, VFD for the main drive, Allen-Bradley CompactLogix PLC, and motor starter for the hydraulic back drive. Control panels are ethernet capable and include 10-inch PanelView Plus HMI screens. Control panels would be installed in the existing control room. Centrisys also provides vibration sensors, bearing temperature sensors, bowl speed sensors for the centrifuges and hydraulic oil level, temperature and pressure sensors for the hydraulic back drives.

Josh Johnson, Brown & Caldwell 23 September 2022 BC Project No. 158211 Page 16

Figure 8: Existing Centrifuge Control Panels

Dewatering Feed Pumps

The existing dewatering feed pumps are located in the pump gallery on the basement level of the Solids Handling Building, as shown on Figure 9. The existing pumps are Wemco recessed impeller pumps with slurry seal at mechanical seals, with a stated capacity of 50 to 100 gpm on plant record drawings; however, plant staff report the pumps likely have greater capacity and are capable of flowing 95 gpm at 30% speed. A pump curve for the Wemco pumps is included as Attachment E. The capacity of the existing pumps will need to be verified to confirm they can provide the required 172 gpm to each centrifuge under Scenario 2.

Plant staff also indicated a flow restriction on the pump discharge piping at the flow meters. The discharge piping necks down to 2 inches and has presented clogging issues in the past. It is recommended that an evaluation be performed for increasing meter size to 4 inches, or installing grinders upstream of the restriction.

Josh Johnson, Brown & Caldwell 23 September 2022 BC Project No. 158211 Page 17

Figure 9: Dewatering Feed Pumps

Polymer System

The existing liquid emulsion dewatering polymer system is located immediately north of the dewatering process area in the Solids Handling Building, as shown on Figure 10. The polymer system is a PolyBlend system manufactured by USFilter. Plant staff have experienced issues with the operation and control of the polymer system stemming from the lack of integration of the PolyBlend equipment with the Alfa-Laval/Sharples centrifuge control panels. Additionally, plant staff have experienced issues with monitoring polymer addition to the centrifuges, inhibiting the plant's ability to optimize the process. Plant staff have indicated a preference to replace the existing polymer system with new equipment supplied by the centrifuge manufacturer to eliminate the integration issues and provide unit responsibility over polymer addition.

Josh Johnson, Brown & Caldwell 23 September 2022 BC Project No. 158211 Page 18

Figure 10: Existing Polymer Area

Additionally, plant staff have indicated that the curb containment surrounding the existing polymer system, shown on Figure 11, makes access into the polymer area for maintenance difficult and has potential for injury. Plant staff have indicated a preference to have the polymer area re-designed, eliminating the containment curbs and providing secondary containment of piping and polymer totes while improving maintenance access and the ability to washdown the polymer area.

Josh Johnson, Brown & Caldwell 23 September 2022 BC Project No. 158211 Page 19

Figure 11: Existing Dewatering Polymer System

Manufacturer proposals include a new liquid emulsion polymer system with feed controls integrated with the new centrifuge control panels. Additional considerations for tote storage and automated switching between polymer pumps may be considered during design. An example polymer system by Velodyne is included as Attachment C. Preliminary design data for the polymer system are summarized in Table 9. Additional discussion with plant staff is recommended to identify whether existing tote storage within the Solids Handling Building is adequate.

Recommended Improvements

Based on the equipment layouts shown on Figures 4 and 5, both the Andritz D5L and Centrisys CS21-4HC selections appear to fit within the existing dewatering process area. Additional investigation is recommended to determine the exact locations, equipment stand heights and conveyor configurations, including angle of incline, for moving the project into detailed design.

Cost Estimate

An Engineer's Opinion of Probable Construction Cost was prepared for the Centrifuge Replacement Evaluation. The following markups were assumed for each alternative in preparation of the opinion of probable construction cost:

- Electrical, Instrumentation, and Controls Cost: 30% of electro-mechanical process areas. Costs do not include replacement of 60MCC1 or 60MCC2.
- Contractor Indirects: 12% of total construction cost (including electrical) to cover mobilization, bonds, insurance.
- Contractor Overhead and Profit (OH&P): 15% of above costs.
- Estimate Contingency: 25% of all costs listed above.
- Construction Cost Escalation: 6.5% per year, assuming 18 months to the mid-point of construction.
- Market Volatility: 10% of all above costs

Following preparation of construction costs, an additional 38% is added to account for soft costs such as engineering, legal, permitting, and administrative costs associated with design and construction. Detailed cost estimates are provided in Attachment D.

Josh Johnson, Brown & Caldwell 23 September 2022 BC Project No. 158211 Page 21

The opinions of probable cost presented in this section are Association for the Advancement of Cost Engineering (AACE) International Class 4 estimates, for which the stated range of accuracy is +40% to -20%. Estimates do not include hazardous materials removal or disposal. Costs assume that structural conditions are suitable and that special foundations are not required. Costs associated with replacement of dewatering feed pumps, installation of grinders, or re-configuration of discharge piping are also not included at this time. Costs for dewatering feed pump improvements may be determined following further investigation of pump capacities during the design stage.

The estimated capital costs for Scenarios 1 and 2 are presented in Table 10. Andritz and Centrisys costs are presented for comparison. Andritz equipment costs are lower in both scenarios, and generally Scenario 1 costs are lower than Scenario 2 due to smaller equipment. The shorter hook lifting heights associated with the smaller Scenario 1 centrifuges also eliminates the need to modify the existing dewatering belt conveyor. The level of redundancy is reduced however under Scenario 1, which requires two centrifuges to operate 16 hours per day at the 2040 maximum week solids loading. Total costs are rounded to the nearest \$100,000, or \$10,000 for areas with costs below \$100,000. Costs presented are inclusive of all markups described above.

	Scenario 1		Scenario 2	
Area	Andritz	Centrisys	Andritz	Centrisys
Demo	\$59,000	\$59,000	\$60,000	\$60,000
Temporary Dewatering Skid	\$230,000	\$230,000	\$230,000	\$230,000
Concrete	\$23,000	\$23,000	\$23,000	\$23,000
Metals	\$0	\$0	\$170,000	\$170,000
High Performance Coatings	\$50,000	\$50,000	\$51,000	\$51,000
Signage	\$3,000	\$3,000	\$3,000	\$3,000
Centrifuges, Polymer, Conveyors	\$3,180,000	\$3,680,000	\$4,190,000	\$4,890,000
Spare Parts	\$54,000	\$54,000	\$55,000	\$54,000
Piping	\$740,000	\$740,000	\$750,000	\$750,000
Flow Meters	\$62,000	\$62,000	\$63.000	\$62,000
Total Capital Costs ^(a,b)	\$4,400,000	\$4,900,000	\$5,600,000	\$6,300,000

Table 10: Capital Costs

Notes:

(a) Capital costs are inclusive of the following markups:

1. Electrical, Instrumentation and Controls = 30% of electro-mechanical areas

- Contractor Indirects = 12%
 Contractor OH&P = 15%
- 4. Contingency = 25%
- 5. Escalation = 6.5% per year, assuming 18 months to mid-point of construction
- 6. Market volatility = 10%
- 7. Soft costs, including engineering, construction management, permits, legal, administrative = 38%.
- (b) Capital costs do not include replacement of MCCs or sludge dewatering feed pumps. Additional investigation is recommended to better define potential improvements for MCCs and sludge dewatering feed pumps.

Josh Johnson, Brown & Caldwell 23 September 2022 BC Project No. 158211 Page 22

O&M costs are inclusive of operator labor, preventative maintenance, repair and replacement, electricity, and chemical usage. Labor costs assume 0.3 full-time employee (FTE) to perform maintenance duties at a burdened rate of \$50 per hour. Electricity costs are based on a rate of \$0.08 per kilowatt hour (kW-hr). The estimated annual O&M costs for Scenarios 1 and 2 are presented in Table 11. Total costs are rounded to the nearest \$1,000.

Item	Scenario 1 ^(a)	Scenario 2 ^(a)	
Labor ^(b)	\$31,000	\$31,000	
Electricity ^(c)	\$10,000	\$9,000	
Chemical ^(d)	\$52,000	\$52,000	
Equipment Maintenance ^(e)	\$14,000	\$20,000	
Total Annual O&M Costs	\$107,000	\$112,000	

Table 11: Annual O&M Costs

Notes:

(a) Costs are rounded to the nearest \$1,000.

(b) Costs assume burden rate of \$50 per hour.

(c) Costs assume \$0.08 per kW-hr.

(d) Costs for liquid emulsion polymer, \$4.20 per active lb. Assumes 20 active lbs polymer/dry ton, and an annualized average of 618 dry tons per year.

(e) Costs are annualized at 2% of equipment costs.

Table 12 presents a planning level opinion of 20-year life-cycle costs, including annual O&M costs and capital costs for Scenarios 1 and 2. The Net Present Value (NPV) represents costs over 20 years in terms of 2022 dollars.

Table 12: Life-Cycle Costs

	Scenario 1		Scenario 2	
Item	Andritz	Centrisys	Andritz	Centrisys
Capital Costs	\$4,400,000	\$4,900,000	\$5,600,000	\$6,300,000
20-year O&M Costs NPV ^(a)	\$2,200,000	\$2,200,000	\$2,300,000	\$2,300,000
Total Life-Cycle Costs	\$6,600,000	\$7,100,000	\$7,900,000	\$8,600,000

Notes:

(a) NPV = Net Present Value includes 3% inflation rate. Discount rate is 2.5%, per OMB Circular A-94, Appendix C.

Josh Johnson, Brown & Caldwell 23 September 2022 BC Project No. 158211 Page 23

Next Steps

Next steps include a confirmation of equipment sizing and selection by the City, and a follow-up discussion with manufacturers related to ancillary equipment and various options available from the manufacturers, including extended warranties, to refine equipment scope of supply and pricing. Next steps may also include contacting manufacturer references and arranging site visits with reference installations to examine the equipment and speak with plant operators.

City of Newport WWTP – Dewatering Upgrade Option 1 - 2 x ANDRITZ D4L Centrifuges

For: Kennedy Jenks To: Ben Bossé Benjamnin.Bosse@KennedyJenks.com Date: 16-Aug-2022 Ref: 3827073-1-Rev-A

Design Criteria

Sludge description: Feed Solids Concentration: Design Hydraulic Load: Maximum Solids Load: Aerobically Digested 1.0-2.0% TS 40-60 gpm 600 lb/hr dry solids

Equipment Selection and Expected Performance

Recommended Model:ANDRITZ D4L CentrifugeDewatered Solids Concentration:16-20% TSSolids Capture Efficiency:95% TSSEstimated Polymer Dosage:16-20 active lbs per ton dry solidsNote: Refer to ANDRITZ Lab Test L-14805

Scope of Supply

- 1. Two ANDRITZ D4L Centrifuges c/w:
 - 2304 duplex stainless steel solid bowl
 - SS316 scroll with tungsten carbide tiles over full length
 - SS316 wetted parts
 - Carbon steel frame with epoxy coating
 - FRP casing cover and drive guards
 - 40 HP Main drive / 10 HP Scroll Drive
 - Cyclo gearbox
 - Grease lubricated bearings, L-10 for 100,000 hours
 - Vibration Isolators

Solids Discharge Connection:

- Flexible connector to SS316 solids chute on conveyor (conveyor by others)
- Centrate Discharge Connection:
 - Centrate de-aerator supplied with top vent connection, bottom centrate discharge connection and sample port with flex connector between de-aerator and centrifuge

Feed Connection:

• SS316 pipe manifold connection for sludge, polymer and wash water c/w a flexible connector

Centrifuge Machine Wiring and Instruments:

- NEMA 4X SS terminal box mounted on centrifuge, with PVC Coated Conduit
- Two Bearing Temperature Sensors
- Two Vibration Sensors
- One (1) Bowl Speed Sensor
- Solenoid valve for centrifuge wash water, brass

ANDRITZ SEPARATION TECHNOLOGIES INC.

1010 Commercial Blvd. S. Arlington, Texas 76001 Tel. (817) 465-5611 Fax (817) 468-3961 www.andritz.com

- 2. Two (2) Centrifuge Starter Panels:
 - NEMA 12 with fans and filters
 - Allen-Bradley PowerFlex 755 VFDs for main drive and back drive
- 3. Two (2) Centrifuge Control Panels:
 - NEMA 4X stainless steel panel with air conditioner
 - Allen-Bradley CompactLogix PLC with ethernet
 - Allne-Bradley Panelview Plus7 10" OIT
 - E-stop
- 4. Two (2) galvanized steel support stands to support centrifuge over inclined conveyor (no access platform)
- 5. Two (2) Emulsion Polymer Systems Velodyne VM-3P-600-D-0-A-1
- 6. One Set of Special Tools Including Lubricants for First Year of Operation
- 7. Engineering and Documentation
- 8. Startup and Training Services 2 trip x 5 days on site per trip
- 9. Freight to Jobsite (2 flatbed loads from ANDRITZ shop, Pittsburg, TX)

Not included: Sludge feed pump and flowmeter, inclined discharge conveyor, spare parts

Budget Pricing

Budget Price for Two (2) ANDRITZ D4L Centrifuge Packages:\$640,000.00Pricing in US Dollars, DDP Jobsite, Taxes Not Included.\$640,000.00

City of Newport WWTP – Dewatering Upgrade Option 2 - 2 x ANDRITZ D5L Centrifuges

For: Kennedy Jenks To: Ben Bossé Benjamnin.Bosse@KennedyJenks.com Date: 22-Aug-2022 Ref: 3827073-2-Rev-B

Design Criteria

Sludge description: Feed Solids Concentration: Design Hydraulic Load: Maximum Solids Load: Aerobically Digested 1.0-2.0% TS 60-100 gpm 1000 lb/hr dry solids

Equipment Selection and Expected Performance

Recommended Model:ANDRITZ D5L CentrifugeDewatered Solids Concentration:16-20% TSSolids Capture Efficiency:95% TSSEstimated Polymer Dosage:16-20 active lbs per ton dry solidsNote: Refer to ANDRITZ Lab Test L-14805

Scope of Supply

- 1. Two ANDRITZ D5L Centrifuges c/w:
 - 2304 duplex stainless steel solid bowl
 - SS316 scroll with tungsten carbide tiles over full length
 - SS316 wetted parts
 - Carbon steel frame with epoxy coating
 - FRP casing cover and drive guards
 - 75 HP Main drive / 20 HP Scroll Drive
 - Cyclo gearbox
 - Grease lubricated bearings, L-10 for 100,000 hours
 - Vibration Isolators

Solids Discharge Connection:

- Flexible connector to SS316 solids chute on conveyor (conveyor by others)
- Centrate Discharge Connection:

• SS316 centrate discharge chute to 8-in. dia. discharge flange, c/w flex connector Feed Connection:

• SS316 pipe manifold connection for sludge, polymer and wash water c/w a flexible connector

Centrifuge Machine Wiring and Instruments:

- NEMA 4X SS terminal box mounted on centrifuge, with PVC Coated Conduit
- Two Bearing Temperature Sensors
- Two Vibration Sensors
- One (1) Bowl Speed Sensor
- Solenoid valve for centrifuge wash water, brass

ANDRITZ SEPARATION TECHNOLOGIES INC.

1010 Commercial Blvd. S. Arlington, Texas 76001 Tel. (817) 465-5611 Fax (817) 468-3961 www.andritz.com

- 2. Two (2) Centrifuge Starter Panels:
 - NEMA 12 with fans and filters
 - Allen-Bradley PowerFlex 755 VFDs for main drive and back drive
- 3. Two (2) Centrifuge Control Panels:
 - NEMA 4X stainless steel panel with air conditioner
 - Allen-Bradley CompactLogix PLC with ethernet
 - Allne-Bradley PanelView Plus7 10" OIT
 - E-stop
- 4. Two (2) galvanized steel support stands to support centrifuge over inclined conveyor (no access platform)
- 5. Two (2) Emulsion Polymer Systems Velodyne VM-5P-1200-D-0-A-1
- 6. One (1) 12" dia. x approx. 12' long run at 27 degree incline shaftless screw conveyor:
 - 12" dia x 3/16" formed U-trough, SS304
 - 12" dia. X 12" pitch shaftless double screw, 8620 high strength carbon steel
 - 12 ga. covers, SS304
 - 5HP @ 20 rpm Nord Drive
 - Flanged drain and wash water nozzle
- 7. One (1) 12" dia. x approx. 22' long run at 27 degree incline shaftless screw conveyor:
 - 12" dia x 3/16" formed U-trough, SS304
 - 12" dia. X 12" pitch shaftless double screw, 8620 high strength carbon steel
 - 12 ga. covers, SS304
 - 5HP @ 20 rpm Nord Drive
 - Flanged drain and wash water nozzle
- 8. One Set of Special Tools Including Lubricants for First Year of Operation
- 9. Engineering and Documentation
- 10. Startup and Training Services 2 trip x 5 days on site per trip
- 11. Freight to Jobsite (2 flatbed loads from ANDRITZ shop, Pittsburg, TX)

Not included: Sludge feed pump and flowmeter, inclined discharge conveyor, spare parts

Budget Pricing

Budget Price for Two (2) ANDRITZ D5L Centrifuge Packages: Pricing in US Dollars, DDP Jobsite, Taxes Not Included. \$946,400.00

ANDRITZ LABORATORY REPORT

COMPANY	:	City of Newport
PLANT	:	City of Newport Wastewater Treatment Plant, Newport, OR
SAMPLE TYPE	:	Aerobically Digested Sludge, Centrate, Cake, Polymer
DATE	:	May 25, 2022

1. Introduction:

A five (5) gallon Aerobically Digested Sludge Sample, one (1) liter Centrate Sample, a Cake Sample and a Polymer Sample were received in the ANDRITZ laboratory on May 11, 2022, from City of Newport Wastewater Treatment Plant (WWTP) in Newport, OR. The sludge sample was sent in for Centrifuge, Screw Press (SP) and Belt Filter Press (BFP) dewatering evaluation.

Centrifuge, Screw Press (SP) and Belt Filter Press (BFP) dewatering evaluation. City of Newport WWTP has a design flow rate of 15 mg/d with an average flow rate of 2.05 mg/d. The existing centrifuge has a flow rate of 180 gallons per minute (3 dry tons/day) with a reported discharge solids of about 20 % Total Solids (TS). They are using an emulsion polymer. After ¹/₄" fine screens and removing grit in the headworks, the sludge is treated with nitrification in an oxidation ditch with mechanical aeration. The sludge is aerobically digested for 9 days.

The current plan is to keep the existing Centrifuge 2, and to replace Centrifuge 1 with a larger unit based on the following design criteria.

Feed Solids Concentration:	1.0 – 1.2 % TS
Maximum Solids Load:	1,000 lb/hr dry solids
Design Hydraulic Load:	200 gpm

2. Objectives:

The specific objectives of these laboratory tests were to:

- 2.1 Analyze the physical properties of the sludge sample received.
- **2.2** Conduct polymer evaluation with the sludge sample received.
- 2.3 Conduct Belt Filter Press (BFP) testing with the sludge sample received.
- **2.4** Conduct Centrifuge spin-down testing with the sludge sample received.
- 2.5 Conduct Screw Press (SP) simulation testing with the sludge sample received.

3. Sample Analysis Test Results and Observations:

3.1 Sample Analysis

The aerobically digested sludge sample received contained 0.66 % Total Solids (TS) and Total Suspended Solids (TSS). The sludge appeared brown and murky with a musky odor. Volatile Solids content of the sludge was 85.5 % of TS. Capillary Suction Time (CTS) was 15.7 seconds, and the conductivity of the sludge was measured at 0.61 mS/cm. When spun at 1,000 – 4,000 Gs for 5 minutes, the spin-down volume ranged from 8.5 - 15.5 % and the plug solids contained 3.4 - 6.0 % TS.

Photo 1 – Sludge as Received

Photo 2 – Spin-Down as Received

The cake sample received had 18.3 % TS.

Photo 3 – Cake as Received

The centrate had visible floating floc that settled quickly causing a high 0.22 % TSS.

Photo 4 – Centrate as Received

4. Polymer Evaluation Test Results and Observations:

4.1 **Polymer Evaluation**

Six (6) polymers, including the plant provided polymer, were evaluated with the sludge sample. Solenis 8848FS and Polydyne C-6266 and plant provided polymer (L-14805) were the most effective in flocculating the sludge sample.

5. Laboratory Belt Filter Press (BFP) Test Results and Observations:

5.1 Laboratory BFP Test

A Belt Filter Press (BFP) test was conducted with the sludge sample. Simulating the ANDRITZ 2m SMX®-S8 Quanum BFP at a throughput 148 gallons per minute (gpm) (478 dry lbs/hr), a cake dryness of 14,.8 % TS was achieved in the laboratory.

Table 5 Centrifuge Spin-Down on Flocculated Sludge Sample

7. Laboratory Screw Press (SP) Test Results and Observations:

7.1 Laboratory SP Test

Screw Press (SP) testing was conducted with the sludge sample by applying gradual pressure to the flocculated sludge sample. At polymer dosage rate of 15.6 active lb / ton TSS, a cake dryness of 12 – 14 % TS was achieved. High amounts of extrusions were observed at the high and low pressure stages in the laboratory indicating a lower capture rate. A cake with 8 - 10 mm thickness was stabilized.

Table 6 Screw Press Evaluation on Flocculated Sample

8. Conclusions:

The sludge sample at 0.66 % Total Suspended Solids (TSS) was dewatered with the Belt Filter Press (BFP), Centrifuge, and Screw Press (SP) evaluation. The BFP achieved a cake dryness of 15 % in the laboratory with the Polydyne C-6266. The Centrifuge achieved a cake dryness of 15 - 18 % TS with the plant polymer and Polydyne C-6266. The SP Simulation had a significant amount of capture loss due to extrusions and achieved a cake dryness of 12 - 14 % TS with Polydyne C-6266.

Opportunity No.: Lab No.: L-14805 Page: 15 (total 15)

Purpose for Laboratory Evaluation (please check):

Preparation for Pilot/Demonstration Testing

Performance Evaluation for Sales Quotation

Other_____

Testing Objectives:

Equipment to be tested:	Belt Filter Press	Centrifuge	Rotary Screen Thickener			
	□ Screw Press	Filter Press	Gravity Belt Thickener			
Hazardous Materials:						
Hazardous or Non-hazardous: OSHA - EPA - DOT.						

If Hazardous the following must be completed or sample will not be received:

- Prior notification to authorized ANDRITZ Laboratory Personnel 45 days before sample shipment. (Per EPA CFR 40 Regulations)
- MSDS supplied.

I acknowledge that the information provided above is truthful and accurate to the best of my knowledge.

Disclaimer: Please note that this is a very preliminary budget proposal .Centrisys would require basis of design, existing facility information and any lab or pilot testing data to confirm the sizing before moving forward with the design stage.

Centrisys is pleased to provide this budget quotation for the following:

ITEM 1 TWO (2) DECANTER CENTRIFUGE UNIT COMPLETE WITH AUTOMATIC HYDRAULIC BACKDRIVE

1.A Centrifuge Specification

Nie of surlies	0
No. of units:	2
Model:	CS18-4 2PH
Inside bowl diameter (in):	18
Bowl length (in):	70
Bowl length to diameter ratio:	4.0:1
Beach angle (deg):	15
Maximum Bowl speed (RPM):	3400
Type of lubrication:	Automatic Grease
Main Motor HP:	40
Back Drive Motor HP:	10
*Max. Hydraulic Loading (gpm)	100
*Max. Solids Loading (lb/hr)	1485
	.

*Maximum loading rates for standard municipal sludges. Does not apply to all applications. Optimal performance does not occur at maximum loading levels.

1.B. Scope of supply

- Each unit will be provided based on the attached drawing

 Duplex SS Solid bowl
 - (ii) Scroll conveyor with Duplex SS Scroll shaft; 304SS flights
 - (iii) 304 SS lower and upper casing
 - (iv) Solid and liquid flexible connectors
 - (v) Dewatered Sludge and Centrate Chutes/Hoppers
 - (vi) Powder coated carbon steel base/frame
 - (vii) Vibration isolators
 - (viii) Spare parts/tools
 - (ix) Control Panel (water cooled)
 - A. 304SS NEMA 4X Enclosure for each centrifuge
 - B. Main circuit breaker
 - C. VFD for main drive motor
 - D. Allen Bradley PLC (compact logix), valve amplifier and motor starter for automatic hydraulic back drive system
 - E. Ethernet communication and historical trending of key parameters
 - F. 10" Allen-Bradley panel view touch screen
 - (x) Instrumentation
 - A. One (1) vibration sensor per unit
 - B. One (1) main bearing temp sensor, type PT100 on each bearing
 - C. One (1) each Bowl/Scroll speed sensor/unit
 - D. One (1) Hydraulic oil level/temp, hydraulic pressure sensor/unit
 - (xi) Automatic Grease Lubrication System
 - A. One (1) low grease level sensor per unit
 - (xii) One (1) trip and 5 days of startup assistance

•	•	•	•	•	

All the above	e for	<u>\$</u>	735,200.00

Optional Ancillary Equip	oment per unit:		
Feed Pump	Adder	\$	12,997
Polymer System	Adder	\$	18,620
Diverter Gate	Adder	\$	14,112
Flowmeter	Adder	\$	6,272
4 ft. Stand	Adder	\$	11,760
4 ft. Stand, Walkway,ladder	Adder	\$	18,620
Conveyor (16 ft.)	Adder	Ś	31,780

PAYMENT TERMS:

30% with order; 60% upon shipment; 10% after startup not to exceed 90 days after shipment.

Lead Time: 20-22 weeks following receipt of the Approved drawings

BUYER/OWNER RESPONSIBILITY (UNLESS INCLUDED AS ADDER):

- Stand
- Feed pump
- Polymer system
- Flow meter
- Cake conveyor
- Anchor bolts.
- Building and building plans (Centrisys provides only the layout drawings without any responsibility of updating any plans or building)
- Building modifications
- Structural and Civil engineering labor
- Lubricants
- All utilities that are required for operation
- Unloading, uncrating, installation and installation supervision. Installation will, at minimum, require a forklift and possibly a crane/hoist.
- Readiness of the Equipment before requesting start-up service. Non-readiness may incur additional charges.
- Compatibility of Equipment materials of construction with process environment.
- Piping connections, platforms, gratings and railings unless stated otherwise. Any other auxiliary equipment or service not detailed above.

Jerod Swanson Regional Sales Manager 9586 58th place Kenosha, WI 53144 Ph: (262) 654-6006 Direct: (612) 401-2006 Email: Jerod.swanson@centrisys.us

Centrisys Representative

Chris McCalib Treatment Equipment Company 249 Main Ave S, Ste 107 #322 North Bend, WA 98045 Direct: (206)909-1546 Email: chris@tec-nw.com

Centrisys is pleased to provide this budget quotation for the following:

ITEM 1. TWO (2) DECANTER CENTRIFUGE UNITS, MODEL CS21-4HC 2PH COMPLETE WITH AUTOMATIC HYDRAULIC BACKDRIVE

1.A Basis of Design – Sludge Feed Characteristics

Industry Type:	Municipal Wastewater
Application:	Aerobic Sludge
Number of units:	Two (one duty, one standby)
Design Feed Flow rate/Unit:	172 gpm (excluding polymer flow)
Hydraulic throughput/Unit:	225 gpm
Dry Solids loading:	585.3 lbs/hr
Feed Concentration:	0.68%
Operation time:	64 hrs/week

1.B Anticipated Performance*

Solids capture rate/recovery:	≥95%
Cake dryness:	20-22%
Max Polymer consumption:	19-22 lbs/Dry Ton

*- Lab sample testing is recommended to confirm

1.C <u>Centrifuge specification</u>

Model:	CS21-4 HC 2PH
Inside bowl diameter (in):	22
Bowl length (in):	100
Bowl length to diameter ratio:	4.3:1
Beach angle (deg):	15
Maximum Bowl speed (RPM):	3150
Type of lubrication:	Grease
Main Motor HP:	75
Back Drive Motor HP:	15

1.D <u>Scope of supply</u>

- 1. Each unit will be provided based on the attached drawing CS21-4HC 2P Centrifuge GA.pdf
 - (i) Centrifugally Casted Duplex SS Solid bowl
 - (ii) Scroll conveyor with Duplex SS Scroll shaft; 316SS flights
 - (iii) 316SS lower and upper casing
 - (iv) Solid and liquid flexible connectors
 - (v) Dewatered Sludge and Centrate Chutes/Hoppers
 - (vi) Powder coated carbon steel base/frame
 - (vii)Vibration isolators
 - (viii) Spare parts/tools
 - (ix) Control Panel (water cooled)
 - A. 304SS NEMA 4X Enclosure for each centrifuge
 - B. Main circuit breaker
 - C. VFD for main drive motor
 - D. Allen Bradley PLC (compact logix), valve amplifier and motor starter for automatic hydraulic back drive system
 - E. Ethernet communication and historical trending of key parameters
 - F. 10" Allen-Bradley panel view touch screen
 - (x) Instrumentation
 - A. One (1) vibration sensor per unit
 - B. One (1) main bearing temperature sensor, type PT100 on each bearing
 - C. One (1) each Bowl/Scroll speed sensor/unit
 - D. One (1) Hydraulic oil level/temp, hydraulic pressure sensor/unit
 - (xi) Automatic Grease Lubrication System
 - A. One (1) low grease level sensor per unit
 - (xii)Two (2) trips and 10 days or 80 hours (whichever occurs first) of startup assistance

1.E Optional Adders

- (i) One (1) 16 foot u-trough conveyor, 9"diameter, approx. 25° incline. Includes motor
- (ii) One (1) 11 foot u-trough conveyor, 9"diameter, approx. 25° incline. Includes motor
- (iii) Power run through equipped on two (2) units.
 - A. This feature allows the centrifuge to create its own power during power loss to allow self-cleaning without plant power input. Also, allows the machine to return to operating speed immediately upon power restore.
- (iv) Remote monitoring equipped on two (2) units.
 - A. This feature is to keep track of the operational and alarm status using plant computer. Also provides real-time text and/or email alerts for any significant system status changes on 32 key operating parameters.
- (v) Two (2) HPU Containment Pans, stainless steel construction.

BUDGET PRICE:	
All of the above for	. \$ <u>948,600</u> USD
OPTIONAL PRICE ADDERS – NOT INCLUDED IN BASE SCOPE OF SUPPLY	
One (1) 16 foot u-trough conveyor, 9" diameter	\$ 38,300 USD
One (1) 11 foot u-trough conveyor, 9" diameter	
Two (2) Power run-through features equipped	\$14,200 USD
Two (2) Remote monitoring feature equipped	\$ 16,900 USD
Two (2) HPU oil containment pans	\$ 5,800 USD
F.O.B. Job Site, freight included, taxes excluded.	
PAYMENT TERMS:	
30% with order; 60% upon shipment; 10% after startup not to exc shipment.	eed 90 days after

Lead Time: 40-45 weeks following receipt of the Approval drawings

Warranty

Five (5) Year Mechanical Warranty

So long as the decanter centrifuge is used for the applications it was designed for and operated, serviced, and maintained per documented Centrisys guidelines, Centrisys shall warrant mechanical centrifuge equipment (centrifuge frame housing and structural rotor components) to be free of manufacturing defects in material and workmanship for a period of five (5) years. Consumables, wear repairs, preventative service from normal use, and provided ancillary equipment is not covered in this extended warranty

Fifteen (15) Year Bowl Warranty

Centrisys provides a fifteen (15) year warranty on the bowl center section, conical, and headwalls. This warranty will be in place as long as the customer has documented inspection and service compliance every 15,000 hours of operation and service is conducted per the supplied O&M manual.

Costs provided with Centrisys quote dated 8/2/2022:

		,	
Polymer System	Adder	\$ 21,756	
- -		,	
4 ft. Stand	Adder	\$ 21,560	

BUYER/OWNER RESPONSIBILITY:

- Stand
- Feed pump
- Polymer system
- Flow meter
- Cake conveyor (adder)
- Anchor bolts.
- Building and building plans (Centrisys provides only the layout drawings without any responsibility of updating any plans or building)
- Building modifications
- Structural and Civil engineering labor
- Lubricants
- All utilities that are required for operation
- Unloading, uncrating, installation and installation supervision. Installation will, at minimum, require a forklift and possibly a crane/hoist.
- Readiness of the Equipment before requesting start-up service. Non-readiness may incur additional charges.
- Compatibility of Equipment materials of construction with process environment.
- Piping connections, platforms, gratings and railings unless stated otherwise.
- Any other auxiliary equipment or service not detailed above.

The Centrisys-Viscotherm Scroll Drive is the **Most Efficient** in the Centrifuge Industry

Benefits of the Centrisys Hydraulics

Our hydraulic scroll drive is powerful and precise, achieving the highest torque-to-weight ratio with the best process control. By using hydraulics we eliminate the gearbox, and as a result simplify the design, radically reducing the number of moving parts and wear components. The Centrisys scroll drive delivers unmatched reliability with lower operating costs— a direct benefit to our customers.

Hydraulics is a Trusted Technology: Whether we realize it or not, hydraulics is a part of our daily lives. It is a reliable and precise technology that delivers maximum power using the smallest footprint. Hydraulic components are a fundamental part of the steering and braking system in every car manufactured today. Hydraulics are used in nearly all forms of daily travel: planes, trains, boats and cars. It is commonly used in manufacturing facilities from heavy lifting to material handling.

2 Hydraulics is a Versatile Application: It is used in industrial, military and transportation applications where there is no room for error, and where work is dangerous, dirty or unforgiving. Examples include jet airliners, railways, ships, nuclear submarines, elevators, construction equipment, mining, drilling, and more. This technology is so versatile that it can be used in widely differing environmental conditions – from the most sterile to the dirtiest.

3 Hydraulic Scroll Drive Increases Capacity: Precise speed control and the highest torque capabilities allow for increased through-put capacities.

Hydraulic Scroll Drive Maximizes Recovered Energy:

The Centrisys CERS (Centrifuge Energy Recovery System) concept is equivalent to technology used in today's hybrid automobiles, high-performance race cars, and the aerospace industry. The Centrisys system captures energy from the rotating bowl. This recovered energy powers the hydraulic scroll drive at shutdown or power failure, allowing for seamless backup continued operation with controlled scroll speed. Since the scroll continues to unload solids from the bowl, it prevents costly dismantling to free up a blocked centrifuge.

Cour Hydraulic Technology Offers the Highest Energy

Efficiency: Hydraulic technology operates independently from the main drive. Gearbox machines generally rely on the main drive; using solids removal mechanisms that apply braking (additional drag) to the bowl and maindrive. (Think of driving a car with the parking brake on.) Unnecessary braking with gearbox technology results in the need for larger main drive motors. Commonly, a centrifuge requires a main drive motor that is 50% larger in comparison to a centrifuge with our hydraulic scroll drive system to accomplish the same job. For every one horsepower needed to move solids out of the machine, one horsepower must be added to the main drive to overcome this braking action. The Centrisys scroll drive uses only the energy needed to drive the scroll; it is independent of the main drive, therefore no energy from the main drive is wasted.

Centrisys-Viscotherm Hydraulic Scroll Drive Based on ROTODIFF Technology **Outperforms** Our Competitors' Gearbox Drive

	Centrisys-Viscotherm Hydraulic Scroll Drive	Competitors' Gearbox Drive	Centrisys Hydraulic Advantage
1	Highest torque-to-weight ratio; allows for proper balance to handle solids and hydraulic flow capacity	Lower torque-to-weight ratio; limits loading of solids, requiring larger or multiple machines	Powerful and Efficient Operation
2	Simple, compact, lightweight design	Complex, heavy design	Lower Maintenance
3	No gears, uses only slow-moving parts; creates less friction	Multiple gears and moving parts at higher speeds; creates more friction and higher power consumption	Long-term Reliability
4	Robust and reliable; process control with direct torque reading. The direct measurement of scroll torque and speed allows immediate response to process changes	Complicated calculations of different speeds through multiple gear reductions/ increases error/ dramatically slows response to process changes	Lower Maintenance, Energy Efficient
5	Simple and accurate measurement of scroll speed; provides precise control of differential with unlimited bowl speed options Differential = speed of ROTODIFF	Complicated, indirect measurement of scroll speed; calculated from bowl and pinion speed, gearbox ratio and control error Differential = (bowl speed – pinion speed) / gearbox ratio	Precise Measurement and Control
6	One set of V-belts	Multiple sets and types of belts	Precise Measurement and Control Lower Maintenance Cost
7	Lower overhung weight reduces load on main bearings; reduces machine vibration; Less weight means less horsepower needed to operate	Heavy overhung gear increases load and heat on main bearings, causing reduced bearing life More weight means more horsepower needed to operate	Lower Maintenance
8	Versatile design for multiple applications	Limited design requires different units for each application	Lower Maintenance, Energy Efficient, Versatile
9	Low energy consumption; power is not lost or wasted. Scroll drive operates independently from the main drive motor	Increased energy cost; gearbox design steals energy from the main drive.	Versatile, Energy Efficient, Lower Operating Cost
10	State-of-the-art technology CERS (Centrifuge Energy Recovery System) allows the hydraulic scroll drive to recover energy at shut down	All energy is lost at shut-down; no power recovered	Energy Efficient
11	100% torque at all speeds, including standstill	Limited torque at maximum differential speed and standstill	More Powerful at All Speeds
12	Full range of differential speeds at all bowl speeds, including zero RPM, startup, shutdown and standstill	Limited range of differential speeds at lower bowl speeds and standstill	More Powerful at All Speeds
13	Low maintenance; continuous cleaning and cooling in a closed, 100% filtered system (filtered to 10 microns)	Unfiltered, uncooled closed system; retains all wear debris possibly shortening the gearbox life	Lower Maintenance, More Reliable
14	Pressure relief valves prevent high shock load, protecting the hydraulic system AND centrifuge; system does not transfer impact force to the shafting	Claims to have high shock load capability, but repeated high shock loads will damage and destroy in-line components and cause premature failure	Lower Maintenance, More Reliable
15	Standard on a Centrisys centrifuge	Standard on competitors' machines; if higher torque is required, hydraulic technology is offered as an upgrade	Lower Cost, Energy Efficient
16	No drag or parasitic loss on the main drive; uses only the energy required to convey solids	Robs energy from main drive; torque adds braking horsepower; increases drag on main drive motor	Efficient Operation
17	Capacity to run leading or lagging (optimized performance)	Limited to a one-direction process	Lower Maintenance, More Powerful and Efficient
18	No overheating of the hydraulic motor due to automatic, continuous heat dissipation through the oil conditioning system	External cooling often required; overheating is a common problem	Lower Maintenance, Longer Life

The **Truth** About Hydraulic Scroll Drives

The Centrisys-Viscotherm hydraulic scroll drive system with ROTODIFF technology is the best in the industry. Check the facts below to clear up any misconceptions about our system.

Misconception: Hydraulic drives are not efficient.

Fact: With ROTODIFF technology our hydraulic system is the most capable in the industry. Fewer (slow-moving) parts create less friction, and energy loss is minimized. Precise control of the scroll at any speed increases centrifuge capabilities

and efficiency, even when loading conditions fluctuate. Hydraulics do not put a drag or load on the main motor and use only the power needed to turn the scroll.

Misconception: A hydraulic system is not effective in messy, dirty or hazardous environments.

Fact: Hydraulic technology is commonly used in rugged environments with high levels of shock, vibration, dust, water, corrosive chemicals and other potential hazards. Industries using hydraulic technology include construction, agriculture, marine, military, mining, paper production, drilling and tunneling. Hydraulic systems are used in mines, chemical plants, near explosives and in paint applications, because they are inherently spark-free and can tolerate high temperatures. Hydraulics have the strength and reliability for jobs requiring the

best, most durable heavy equipment.

Misconception: Hydraulic systems are noisy. Fact: Our hydraulic scroll drive is quieter than a gearbox. It has been shown to reduce ambient

noise by 15 dB over the older electric scroll drives.

Misconception: Hydraulic systems are messy and leak. Fact: Because fluids are enclosed in a contained system, there is virtually no leakage in modern hydraulics. Advanced sealing techniques and materials and state-of-the-art electronics are so efficient that today's manufacturers can raise the operating pressures of their pumps. It is not unusual to find hydraulic systems operating without leakage at pressures 2,000-3,000 psi higher than just a few years ago.

Misconception: A hydraulic drive is difficult to repair, requiring specialized technicians with hydraulic experience.

Fact: With fewer slow-moving parts and a less complicated design, hydraulic drives are easier to repair than a standard gearbox. Maintenance technicians with the skills to fix gearbox drives are more than capable of repair and maintenance with hydraulics.

Misconception: Hydraulic systems are more maintenanceintense than a typical gearbox.

Fact: On average, hydraulics need only simple oil and filter preventive maintenance, just like a car.

Misconception: Parts for the hydraulic drive are difficult to source.

Fact: Centrisys has distribution centers across the United States and around the world for all hydraulic components. In fact, many parts can be shipped express overnight delivery.

Misconception: Hydraulic technology is old and abandoned by other centrifuge manufacturers.

Fact: Hydraulic technology remains a dominant system in modern industrial manufacturing. No other system is as efficient and effective in transferring energy through small tubes or hoses and other hard-to-reach parts. Hydraulic innovation is progressing at an astonishing rate – so quickly that some experts cite more progress in the last ten years than in the 50 preceding years combined. Competitive centrifuge suppliers have not abandoned a hydraulic scroll drive, since most will offer it as an upgrade to the gearbox.

The Choice is Clear

When you compare the Centrisys hydraulic scroll drive to a gearbox drive, the better choice is the Centrisys system. Centrisys is the only USA repair facility (besides Viscotherm affiliates) authorized by Viscotherm AG to repair, service, and perform warranty work on Viscotherm hydraulic components in North America. Contact Centrisys for more information on products, hydraulic scroll drive, service, parts or any other questions

Attachment C: Velodyne Polymer System

OPTION #2 DESCRIPTION

1 VeloBlend Model VM-5P-1200-D-0-A-1 Liquid Polymer Blending System

Polymer Flow Range: 0.25 to 5 GPH Dilution Water Flow: 120 to 1200 GPH

Each unit shall include the following unless otherwise indicated:

- 1 Polymer Mixing Chamber:
 - A. Series: VeloBlend VM
 - B. Type: Staged Hydro-Mechanical
 - C. Mixer Motor: 1/2 HP, 90 VDC, 1750 RPM, wash-down duty
 - D. Mixer Shaft Seal: Mechanical with seal flushing assembly
 - E. VeloCheckTM Neat Polymer Check Valve with Quick Release Pin
 - F. Construction:
 - 1. Body: Stainless steel
 - 2. Impeller: Stainless steel
 - 3. Mechanical Seal: Ceramic, Carbon, Stainless steel, Viton
 - 4. Cover: Clear polycarbonate with stainless steel reinforced flange & discharge
 - G. Pressure Rating: 100 psi
 - H. Pressure Relief Valve: Brass
- Neat Polymer Metering Pump Assembly: 1
 - A. PVC FNPT union style polymer inlet

 - B. Type: Progressive Cavity typeC. Motor: ½ HP, 1750 RPM, 90 VDC, Wash-down duty motor with gear reducer
 - D. Loss of polymer flow sensor
 - E. Metering pump calibration assembly with isolation valves: 500 ml
 - F. Plumbing: SCH. 80 PVC
- Dilution Water Inlet Assembly shall be provided, including the following: 1
 - A. Stainless steel FNPT water inlet connection
 - B. Dilution water ON/OFF solenoid valve
 - C. Control Valve: Manual rate control valve
 - D. Primary dilution water flow meter type: Rotameter
 - E. Low differential pressure alarm switch
 - 0-160 psi inlet water pressure gauge (stainless steel, liquid filled) F.
 - G. Plumbing: SCH. 80 PVC
- 1 Solution Discharge Assembly:
 - A. Stainless steel FNPT solution discharge connection
 - B. 0-160 psi solution discharge pressure gauge (stainless steel, liquid filled)
 - C. Plumbing: SCH. 80 PVC
- Control Panel: 1
 - A. Enclosure: NEMA 4X FRP
 - B. Power:
 - 1. Required: 120 VAC, 60 Hz., 1 Ph
 - 2. Disconnect: 10' power cord with 120 VAC plug
 - C. Motor controllers:
 - 1. Mixing Chamber
 - 2. Neat polymer metering pump
 - D. Miscellaneous:
 - 1. Control circuit protection
 - 2. Control relays
 - 3. Power supplies
 - 4. Grounding blocks
 - 5. Numbers terminal blocks
 - 6. Wire labels, shrink-tube type

Project: Newport WWTP, OR Proposal #: LP22-3971-0

Page 4 of 10

Date: 8/8/2022

QTY.
- E. Operator Interface Discrete Selector Switch
 - 1. System ON / OFF (reset) / REMOTE
 - Ten-Turn Potentiometer Metering Pump Control
 One-Turn Potentiometer Mixer Speed Control
- F. Status / Alarm Indicators:
 - 1. System Running Indication
 - 2. Main Power ON Indication
 - 3. LED Display Metering Pump Rate
 - 4. Low Water Differential Pressure Alarm
 - 5. Low Polymer Flow Alarm
- G. Inputs (signals by others):
 - 1. Remote Start / Stop (discrete dry contact)
 - 2. Pacing Signal Based on Process Flow (4-20mA)
- H. Outputs:
 - 1. System Running (discrete dry contact)
 - 2. System Remote Mode (discrete dry contact)
 - 3. Common Alarm (discrete dry contact)
- System Skid:
 - A. Frame: 304 stainless steel, open frame design for access to all components
 - B. Fasteners: 304 SS
 - C. Designed for bolt-down

Meeting Minutes

Street Address City, ST Zip

T: 503.244.7005 F: 503.244.9095

Prepared for:City of NewportProject Title:WWTP Master PlanProject No.:158211 / Task Order 26

Purpose of Meeting:	Alternatives Evaluation Workshop	Date: April 25, 2023
Meeting Location:	Vance Avery WWTP	Time: 10:00 a.m. – 2:00 p.m.
Minutes Prepared by:	Jennifer Kersh, BC	

Attendees:David Powell, NewportJennifeAaron Collett, NewportHolly TA. Grant, NewportAdam IClare Paul, NewportMark CMark Strahota, BCBen BoJosh Johnson, BCGreg Humm, BC

Jennifer Kersh, BC Holly Tichenor, BC Adam Klein, BC Mark Cullington, KJ Ben Bosse, KJ

The notes below summarize key discussions with City of Newport staff:

General/Schedule

- 1. Dave Powell will present to city council on June 5 to advocate for funding required for the WWTP improvements. Council is aware approximately \$60 million is planned.
- 2. Dave has 5-10 minutes to present the latest information from the master planning effort.
- 3. BC offered to prepare a short presentation for the upcoming meeting.
- 4. Rates will be raised by about 12% at the end of June with potentially more increases into the future.
- 5. Clare recommended uploading a draft master plan report online for public comment when ready.

Critical Success Factors

- 1. Add communication of the need and urgency of upgrades as a CSF.
 - a. Public outreach needed for rate increase.

Flows and Loads

- 1. Loading to the WWTP is expected to increase by about 12% by 2040.
- 2. As discussed previously, Newport is subject to a sharp increase in flows and loads during the summer months and holiday weekends due to increases in tourism.
- 3. Additional development is expected even in areas that appear "undevelopable" due to steep slopes (this is largely driven by a tight housing market).

- 4. Base flow forecasts are based on permanent residents, but peak flows are tourism driven i.e. peak BOD load occurs on summer holiday weekends.
- 5. BC will include a discussion regarding major industry/tourism influences in the master plan.
- 6. Aaron recommended these concepts be distilled down to simple graphics for presentation to city council. Technical graphs are too detailed for this purpose.

WWTP Alternatives

- 1. Composing and drying:
 - a. Composting can be odorous but can be controlled by covering the process and/or using room ventilation. Foul air control and leachate control are critical.
 - b. Mark C. recommended the City visit facilities currently composting and drying for comparative purposes.
 - c. Approximately one full-time equivalent (FTE) is recommended that is dedicated to the composting process.
 - d. Composting is more dependent on biosolids land application than dryers due to quantity of solids. During the off-season, additional measures such as bagging/storage may be required.
 - i. Some agencies are able to send compost to landscaping companies, where it is blended as a commercial product.
 - e. Composting provides a "Class B offramp" for the timeframes a Class A product is not required.
 - f. Per Grant, composting is labor intensive and logistically difficult.
 - g. Drying is a mature technology that is more common on the east coast where land application is not as practical.
 - h. A stabilization process is recommended upstream of the drying process. Otherwise the rewetted product is odorous.
 - i. Drying requires a much smaller footprint than composting.
 - j. Drying is recommended as a precursor for treatment of PFAS. Ceiling limits for land application are not anticipated to be incorporated into regulations in the near future.
 - k. Grant has concerns with fire hazards associated with dryers.
 - I. Aaron notes they still get complaints when biosolids trucks go by due primarily to lack of understanding / familiarity.
 - m. Grant points out that composted biosolids meet Class A, as the plant currently does, but composted biosolids look more like a landscaping product with the added carbon material.
 - n. Dave mentioned certain members of City Council strongly prefer greener and more environmentally friendly options. Composting may be more "publicly palatable" for this reason.
- 2. Aerobic versus anaerobic digestion:
 - a. Gas produced from anaerobic digestion can potentially be reused for digestor heating and other processes such as drying.
 - b. Grant noted that captured gas must be cleaned prior reuse. Flaring of the gas may be a simpler option.
 - c. Clare prefers aerobic digestion as anaerobic digestion is more typical for larger treatment plants.
- 3. Primary clarifiers versus a second oxidation ditch:
 - a. Grant suggested primary clarifiers could act as a stabilization tank to accommodate for slug loading to the plant.
 - b. Adam suggested a selector could be added upstream of an oxidation ditch to potentially serve the same purpose.

- c. A bypass line could be routed around the primary clarifiers to provide additional process flexibility.
- 4. Odor control:
 - a. Dave inquired whether odor control would be added to each process or a single odor control unit would service the entire plant. Due to costs associated with running duct-work around the entire plant, individual odor control units (carbon scrubbers) are recommended at each process with short runs of ductwork to the odorous areas.
 - b. Grant mentioned winter and summer sludges are distinctly different, with different odors.
 - c. Options with no stabilization are significantly more odorous and would require additional odor control measures.
- 5. Scoring:
 - a. Greg suggested the scoring criteria adopted may be overly complex. Two categories may be simpler and more appropriate for the evaluation. "Community" and "operations" were recommended.
 - b. "Community" could refer to the benefits associated with less odorous options, greener/environmentally friendly options, and options that create local jobs.

Communication/Funding Support

- 1. Dave is currently trying to gain support from the Council for \$60 million for the recommended upgrades. To help cover the costs, a 12% rate increase has been approved and will be effective at the end of June, with more increases possible afterwards.
- 2. Dave suggested the Council may be leaning on the City Manager for approval to move forward on obtaining additional funding. There seems to be a lack of effective communication within the Council and limited understanding of the key issues. The Council tends to prioritize other issues over the WWTP, such as homelessness, parks, and dam improvements.
- 3. Holly presented a recent example from Vancouver, WA that demonstrated an effort to secure funding for critical upgrades. She stressed the importance of simple and effective graphics, with personal elements such as photos of operators and workers. She recommended having individual conversations with each Council member, which could be effective in swaying the decisions of the entire Council and securing the required funding.
- 4. Dave intends to keep the project phasing as is and suggested the column chart graphic with funding plan for council use.
- 5. Question about differences between master planning and facility planning based on funding questions. Facility Plan may require official DEQ submittal, but BC will confirm and follow up. Aaron notes that grants are available from Business Oregon for Facility Plan costs, which may apply to this project.

WWTP Headworks

- 1. Clare noted there is significant rusting on the underside of the headworks building, and Grant agreed.
- 2. For Alternative 2, Grant suggested the proposed layout of the new screens could be flipped to optimize access to the doors on the new screens. BC has no concerns with this re-arrangement.
- 3. The City agreed in concept to carbon adsorption as the preferred odor control option.
- 4. "Ragging" has been a significant issue with the existing auger screens.
- 5. It was noted the preliminary costs presented are construction only and do not include engineering and administrative costs.

Northside PS Alternatives

- 1. Greg presented a summary of the alternatives, associated costs, and phasing options for Northside PS. Four options have been developed two are short term options that are designed to smooth out cash flow with WWTP costs and two are long term, buildout options.
- 2. The options had been discussed in previous meetings with David and Grant. The outcome of those meeting has been a consensus to proceed with Alternative 2 which will make improvements to the existing NSPS to replace aging equipment to improve reliability and upgrade other areas of the facility to allow it to operate for another 10+ years. During that 10 year +/- interval, the City will be making investments at the WWTP. At the end of the 10 year +/- interval, a new buildout pump station will need to be constructed and the existing NSPS decommissioned.
- 3. Estimated construction costs for the 4 alternatives have now been developed and these were presented as well.
- 4. The MP will describe each alternative and recommend implementation of Alternative 2. David, Clare, Grant, and Aaron were in agreement with this decision.

Conclusions and Next Steps

- 1. Additional discussion is required to confirm the requirements for the upcoming facilities plan that will follow the master plan report.
- 2. BC to recommend a single WWTP alternative as a part of the master plan, guided by discussions in the workshop.
- 3. BC to provide a finalized master plan report to the City at the end of June.

Section 1: Introduction and Facility Overview

1.1 Purpose

This memorandum is a component of the City of Newport's (City) Wastewater Treatment Master Plan (WWTMP). The purpose of the WWTMP is to evaluate the City's existing wastewater treatment infrastructure, operational procedures, and equipment performance and develop a 20-year Capital Improvement Plan (CIP) that will address treatment needs for the projected population growth, future flow and organic load conditions, and possible future regulations.

Development of the CIP involves identifying and comparing improvement alternatives based on criticality, estimated capital costs, estimated operation and maintenance costs, risks, and cash flow. An implementation schedule outlining the timing and phasing of improvements is a key element of the CIP.

This memorandum presents this information specifically for the Northside Pump Station (NSPS). Alternatives for improving and upgrading the facility are developed and evaluated. Based on the outcome of this evaluation, recommended upgrades are described and an overall plan for the facility and site has been formulated. The cost and timing for making the recommended upgrades has been integrated into the overall wastewater CIP.

1.2 Background

In 2002, the City constructed the Vance Avery Wastewater Treatment Plant (WWTP) in South Beach, Oregon. In doing so, the former WWTP located north of Yaquina Bay was decommissioned and transformed into a pumping facility that functions to pump wastewater to the new WWTP. The pump station is now known as the NSPS.

The pump station itself was constructed using one of the clarifier basins from the existing WWTP to form the screening channels, grit basin, wetwell, and pump room. As a result, the station is unique and the wetwell layout is unusual in terms of meeting industry-wide design standards. Even so, the facility has served its purpose very well since it was re-purposed as a pumping facility in 2002. On the other hand, the uniqueness of the station also creates performance and operational issues which will be presented in this memorandum.

Approximately 90-percent of the City's wastewater is generated through development north of Yaquina Bay. This significant portion of the overall wastewater flow is conveyed to the NSPS and then pumped to the WWTP through a force main that crosses the bay. Removal of rags, grit, sand, and other solid materials from the wastewater is critical to wastewater conveyance to the WWTP. Poor removal performance will result in an accumulation of material in the force main, eventually impacting hydraulic capacity or possibly blocking the pipe entirely. Cleaning the pipe is inherently difficult due to the length and installation on the bay bottom, so efficient removal of debris is vitally important.

The NSPS has been in service for over 20 years and its equipment is approaching the end of its service life. Maintenance costs are expected to increase, and the reliability of the facility will become increasingly more important as the facility continues to age. Additionally, several operator safety issues are evident and require correction. With these issues growing more significant over time, the City has requested an analysis of NSPS improvement options as part of the overall WWTMP that Brown and Caldwell (BC) is preparing.

Section 2: Current Conditions, Station Performance, and Previous Work

2.1 Facility Description

The NSPS utilizes two inclined screw-type mechanical screens to removed rags and other large debris from the influent wastewater. A grit removal basin is used to remove grit and other settleable debris from the influent wastewater to provide preliminary treatment. Accumulated grit is removed from the basin in a slurry, which is then dewatered. Material removed by the screens is bagged and manually transported in a wheelbarrow to a dumpster, which also receives dewatered grit from the grit removal process.

The wastewater enters the pump station through three channels where the three existing screening systems are located-the two outer channels contain the mechanical screens and the middle channel has a manual bar screen. Once the wastewater passes the screens, it moves to the grit chamber where further separation of sand, gravel, and other heavy solids takes place. Following the grit chamber is the wetwell where water collects before being pumped to the WWTP.

2.2 Site Development

As noted above, the NSPS site was formerly the City's original WWTP. Several abandoned and decommissioned wastewater structures still exist on the site. These include a trickling filter, clarifier basins, an anaerobic digestion facility, and chlorine contact basin. A network of buried piping and electrical ductbanks also exist below the ground surface, most notably the influent gravity sewer pipe and effluent pipeline which are still in use and are critical to continued operation.

Additionally, the site is used by other City departments including the fire department for training, police department for impounding vehicles, and a public works maintenance shop. Although these facilities and activities can co-exist with wastewater operations, it would be beneficial to eventually reduce or eliminate these additional activities being performed onsite altogether, so that the site is dedicated exclusively to wastewater operations. The City plans to begin this effort by relocating the vehicle impoundment activities by the police department to the WWTP.

A suggested site layout that accounts for a future new pump station is shown in Figure 1. The layout is based on demolition of decommissioned wastewater structures (i.e., trickling filter, digestion facility, and clarifiers), elimination of police activities, construction of a dechlorination facility and vehicle parking garage, and a future NSPS. Demolition of wastewater structures can happen over time as funds become available and as additional space is needed. The fire department training facility would remain, as there are no alternate locations for this type of facility within the City.

Figure 1. Site Development with new (future) pump station

2.3 Condition Assessments

Condition assessments were previously completed by Waterdude Solutions (Waterdude) and BC to identify conditions within the NSPS that require attention. These assessments are summarized in this section.

2.3.1 Waterdude 2018 Assessment

A condition assessment was completed by Waterdude for the WWTP and NSPS. Waterdude prepared an initial condition assessment report in January 2018 and an update to this report in 2021. Their *Wastewater Treatment Facilities Condition Assessment Update*, dated October 11, 2021, provides a criticality assessment which evaluates the overall condition rating of each system and identifies systems that pose the highest risk. The systems that are deemed most at risk are:

- NSPS
- Headworks
- Septage
- Solids Handling

Specifically, for the NSPS, the 2021 update report concludes that screening and grit removal systems and the pump station structure itself are in Fair to Poor condition. The condition of the station is a challenge to the ongoing operation and maintenance of the station. The screens were determined to be approaching their end of service life and the geodesic dome over the structure is leaking and in poor condition. Leaks are noted to cause humid conditions inside the structure which results in corrosion, slip hazards, and premature electrical equipment failure. Furthermore, odorous air treatment is not occurring because the odor control system is not in use.

2.3.2 Brown and Caldwell 2019 Assessments

In addition, BC also performed inspections of the facility to assess its condition and identify problem areas. An inspection performed in May 2019 identified the following issues:

- An electrical fault on the power cables feeding Raw Sewage Pump No. 1 required replacement of the cables using the spare conduit that was originally provided for (un-installed) Pump No. 4. Field tests determined that numerous existing power cables between the Electrical Building and pump station are in poor condition and should be replaced. Refer to Section 3.4.1 for additional detail.
- Grit system is in poor condition and lacks the redundancy that should be provided given the potential for blockage of the force main from an accumulation of solids that would pass through the station in the event the grit system is out-of-service. Failure of the grit piping in the lower pump room would cause flooding of the station. Overall, the grit system is considered high risk in terms of reliability; there are consequences of system failure. Refer to Section 3.2 for additional detail.
- The geodesic dome cover is leaking primarily where the structural supports anchor to the perimeter concrete wall. See photos in Figure 2 on the following page. These connections are complicated with structural shapes coming together at various angles with numerous bolts and gusset plates. Sealing these connections is difficult to accomplish properly, causing leakage to occur at these locations. The cover is also leaking at localized spots throughout the cover panels. These leaks are likely the result of deterioration of the seals at the edges of the individual triangular cover panels. Refer to Section 3.3 for additional details.

Figure 2. Examples of rainwater leakage through geodesic dome

2.3.3 Electrical Investigation

In 2012, an electrical fault occurred within the power cables feeding Raw Sewage Pump No. 1. The fault occurred on the load-side cables to the pump motor and was resolved by installing new conductors to the motor using the spare conduit to (un-installed) Pump No. 4. Although the exact cause of failure is unknown, it was suspected that the buried ductbank between the Electrical Building and the pump station had been damaged, possibly due to settlement. An investigation was conducted in May 2019 to test the other cables in the same ductbank to determine whether other existing circuits were also damaged or at risk of failure.

Based on the testing results and visual observations, the action items listed below were provided to the City in May 2019.

- 1. Replace the existing power cables for Raw Sewage Pumps No. 1, 2, and 3 with new variable frequency drive (VFD)-rated, multi-conductor cable with grounds.
- 2. Replace the existing conductor cables for Rotary Screen No. 1 with new conductors.
- 3. Existing spare conduits between the Electrical Building and the pump station are suitable for use provided each conduit is tested and cleaned prior to pulling new cables into place.
- 4. Install new conduits between the Electrical Building and the pump station for future equipment (Grit Pump No. 2, Raw Sewage Pump No. 4, Screenings Conveyor, plus any spare conduits). These can be installed in either an overhead configuration or buried. If buried, inspect the existing ductbank for damage when it is exposed for construction of the new conduits.

2.3.4 Remaining Useful Life Estimates

Results from the condition assessments and electrical investigation described above informed general estimates of the remaining useful life (RUL). Developing RUL estimates can be risk- and scientifically-based, highly detailed assessments that are generated through statistical analysis of operation and maintenance

information. RUL estimates prepared for this planning level effort have not been made using these detailed analyses; rather, they are general estimates that have been developed to provide a framework for prioritizing and scheduling upgrades and improvements to the NSPS.

The generalized approach taken to develop RUL estimates consisted of estimating remaining life for individual components of the overall facility. These estimates are tabulated in Table 1.

Table 1. Estimated RUL for Station Components and Basis for Remaining Life Estimates		
Station Component	Estimated RUL (years)	Basis for RUL Estimate
Screens	2-3	Poor condition, numerous known issues impacting remaining life.
Grit System	2-5	Condition of paddle in grit basin is unknown (not visible). An un-installed replacement grit pump is available. Classifier and washer are in poor condition. Grit piping and valves are likely near end of service life due to abrasive conditions.
Electrical Wiring to Pumps	2-4	Known deterioration of conductors between Electrical Building and pump station, likely remaining life of two to four years.
Ventilation System	3-5	Supply fan and foul air fans likely at end of life; odor treatment system is not functional; louvers have deteriorated and require replacement.
Geodesic Dome	10-15	Dome has localized leakage points and City employees report deterioration. Life may possibly be extended through on-going maintenance.
Electrical and Instrumentation Systems	5-10	Motor Control Center (MCC) needs a thorough assessment, approximately ten years of remaining service would be expected. Control panels within pump station are in poor condition although internal components may be operable for five to ten years
Wastewater Pumps	10-15	Pumps are in good condition; a spare, un-installed pump is available. Normal, on-going maintenance is necessary.
Wastewater Piping and Valves	20-30	Appears to be in good condition.
Concrete Structure	20-30	Structure is in good condition; minor, localized signs of degradation. Wetwell is not visible, an inspection is needed to determine actual condition.

The assessments from Table 1 above are shown graphically in Figure 3.

Notes:

- 1 Assessment is needed
- 2 Condition of concrete within wetwell is unknown

Figure 3. Summarized graphical representation of RUL estimates

Brown AND Caldwell

Observations that can be made using the condition assessment information and general RUL estimates described above include:

- High priority improvements include replacing the screens and grit system components, electrical cables to the Raw Sewage Pumps, and ventilation fans.
- At least three components of the NSPS are of immediate concern and replacement to these components should be considered a high priority for continued moderately reliable operation until more extensive improvements, or a new pumping facility, can be constructed and placed into service.
- A pivot point of about ten years seems apparent. With completion of the high-priority improvements (i.e., screens, grit system, electrical cables, and fans), reliable operation of the facility for another ten years appears realistic. Reliability concerns will begin increasing towards the end of that time and beyond unless additional improvements are made. If those additional improvements are completed, the existing facility could have a realistic service life of twenty years or more (beyond the initial ten years).

These observations have allowed development of upgrade alternatives for the facility. These are presented in Section 4.1 and described in Table 2 on the following page.

Table 2. Upgrade Alternatives for NSPS Based on RUL			
Alternative Name Description			
Alternative 1	"Bare Minimum" Alternative	Make immediate minor improvements to increase reliability and provide time for design and construction of a new buildout pump station, then abandon/decommission the existing NSPS.	
Alternative 2	"10-Year Alternative"	Replace equipment to extend service life by ten years to allow the City to make investments at the WWTP, then construct a new pump station and abandon/decommission the existing NSPS.	
Alternative 3	"New Dry Weather Facility"	Construct a new pumping facility with capacity for dry weather flows and upgrade the existing NSPS to serve as a wet weather pumping facility.	
Alternative 4	"New Buildout Facility"	Construct a new pumping facility with capacity for buildout flows and abandon/decommission the existing NSPS.	

2.4 Operational Performance of Screens

Screen performance has been historically problematic and tolerable operation has been diminishing over time. Screen performance issues include:

- Inefficiency at moving floating material from the channel-debris becomes trapped in the approach channel and must be manually removed.
- Overall poor debris removal performance causing blinding, reducing hydraulic capacity resulting in surcharging the influent sewer, ultimately resulting in overflows at the upstream manhole (MH).
- Debris accumulation in the compaction chamber at the top of the screen, causing jamming of the unit and requiring manual removal by operations staff.
- Corrosion and overall degradation of the equipment leading to a lack of cleanliness of the area around the screens and leakage.
- Handling of screened material and transporting bagged debris to the dumpster resulting in significant manual labor and negative impacts to operator safety.

Figure 4. Existing Auger Screens

2.5 Previous Upgrade Projects

In 2018, the City considered the replacement of a screen. In 2023, the design of a dechlorination facility was completed. The details of these projects are discussed in this section.

2.5.1 Screen Replacement Project

The City initiated a screen replacement project in 2018 but halted the project before the final design phase. The scope of the project included an analysis of feasible alternatives for replacing the existing screens with new screens and improvements to the screenings processing and management systems. The analysis considered available types of screens, screening washing/compacting systems, conveying systems, and alternatives for improving hydraulics in the existing channel. Reliability and redundancy considerations were identified and capital, operations, and maintenance costs for implementing the recommended improvements were developed. Refer to Section 3.1 for additional details.

2.5.2 Effluent Dechlorination Facility

Currently, effluent is chlorinated at the WWTP to comply with disinfection requirements stipulated in the National Pollutant Discharge Elimination System (NPDES) discharge permit. The chlorine dose is set such that residual chlorine is below the permitted concentration prior to discharge. The point of compliance is at the NSPS. However, without a means of controlling effluent residual chlorine dose through a dechlorination process, compliance with the permitted effluent chlorine concentration limit is difficult. The limit has been exceeded periodically in violation of the NPDES permit.

To improve control and better achieve compliance, the Oregon Department of Environmental Quality (DEQ) is requiring the City to dechlorinate the final effluent prior to discharge. A dechlorination facility that would meter sodium bisulfite into the effluent to reduce and control residual chlorine concentration will be needed at the NSPS. The City is currently working to establish funding for this facility. When funding is in place, design is scheduled to begin in Summer 2023 and construction of the facility will be completed in 2024.

In addition to constructing the new sodium bisulfite facility, two existing structures at the site are to be demolished to create space for parking, turn-around for chemical deliveries, a new vehicle garage (preengineered metal building), and a future replacement pump station. Specifically, the existing digester and clarifier structures at the NSPS site are to be demolished with a new vehicle storage garage constructed.

Section 3: Improvements to Existing NSPS

Four alternatives for improving the NSPS have been developed as summarized in Table 2 and described in detail in Section 4. In three of these alternatives, the existing NSPS would be upgraded and would remain in service-at least in the near term. Alternative 4 is the only alternative that involves immediately constructing a new pumping facility and decommissioning the existing station.

Thus, improvements to the existing NSPS that would be undertaken in Alternatives 1, 2, and 3 have been defined through the previous work described in the preceding sections. These are briefly described in the following sections with references to previous documents have can be referenced for additional detail.

3.1 Screening Process Improvements

Channel modifications to reduce surcharging the incoming sewer pipe during high-flow events were developed as part of the screen replacement project. The modifications are described in this section.

3.1.1 Overview

Wastewater flows from the influent sewer pipe into a head box at the upstream end of the three screen channels. After passing through the screens, the wastewater enters the grit chamber and then flows into the wetwell.

During high flow events, the headloss through the channels and screens causes water to back up into the head box and influent pipe. Plugging or "blinding" of the screens caused by poor screen performance further restricts flow from passing into the downstream grit chamber. In the past, the combination of high flows, screen blinding, and headlosses through the system has resulted in overtopping MH-1, which is at the entrance to the pump station.

3.1.2 Hydraulic Performance

A hydraulic analysis was completed to assess the hydraulic performance of the channels, establish the hydraulic capacities of each screen channel, and determine the allowable headloss through the channels.

A Visual Hydraulic model of the screen channel arrangement was developed and used to assess the flow split between the channels. With two channels in operation, an unequal flow distribution is apparent with about 5.4 million gallons per day (mgd) conveyed through the Screen 1 channel and 3.8 mgd through the Screen 2 channel. Unequal flow distribution will tend to overload Screen 1 with debris, increasing the risk of blinding-refer to Figure 5.

The Visual Hydraulics model was also used to assess the risk of overflowing MH-1. Assuming six inches of headloss through the screens and with unequal flow distribution through the channels, the peak flow rate of 9.2 mgd would surcharge the incoming sewer such that the water surface elevation in MH-1 will be only about 1.2 feet below the MH rim. Screen losses are dynamic and fluctuate according to the amount of debris that has accumulated on the screen. The screen loss increases as debris collects on the face of the screen and decreases after the screen is cleaned. As a result, the existing screens that are installed in the channels have blinded and caused overtopping of MH-1 in the past.

Water surface elevations at peak flow are shown in Figure 6.

Figure 5. Flow Distribution Diagram-Existing Screen Channel

Figure 6. Water Surface Elevations at Screen Channel

3.1.3 Screen Channel Modifications for Improved Performance

Equalizing the distribution of flow between the three channels and reducing the risk of overflowing MH-1 can be accomplished through channel modifications. These modifications, shown in Figure 7, would be made in conjunction with installation of new screens in the channels. A screenings conveyor could also be installed as described in Section 3.1.5.

One of the three existing channels would be configured as an emergency bypass channel that would route flow around the screens, in the event they become blinded, and their combined capacity is less than the influent flow rate. The water level upstream of the screens would increase to a point where the level is above the elevation of the bypass weir. From which, water begins to enter the emergency channel flowing directly into the wetwell.

Use of contents on this sheet is subject to the limitations specified at the beginning of this document.

3.1.4 Screen Replacement

A wide variety of screening technologies and screen designs are offered by reputable manufacturers with extensive experience in the wastewater industry. Screen options are typically evaluated during a preliminary design phase, thus selecting a specific screen technology would be beyond the scope of a planning study.

For the purposes of this planning study, it is assumed that the new screens will match the type of screen that will be installed at the WWTP headworks. Table 3 below provides the recommended basis of design.

Table 3. Recommended Basis of Design for Replacement Screens at Existing NSPS			
Design Parameter	Value		
Number of Mechanical Screens (installed in outside channels)	2		
Flow Capacity, each	5.4 mgd		
Number of Channels and Screens in Operation	1 at flows up to 4.6 mgd 2 at flows above 4.6 mgd		
Number of Bar Racks (installed in center channel)	1		
WS Elevation in MH #1 at Peak Flow (assumes 6" loss across screens)	EL 83.8		
Freeboard in MH #1	1.2 feet		
Freeboard in Screen Channel	3.5 feet		

3.1.5 Screening Conveyor

Material removed by the existing screens is compacted and discharged from the screen into a plastic bag. A wheelbarrow is placed below the discharge chute to hold the bag, so it does not break open. When the bag is full, the operators must maneuver the wheelbarrow over to the dumpster, lift the heavy bag into a pivoting trough device, and manually flip the trough so the bags fall into the dumpster. This procedure has caused back and hand injuries and is an on-going safety issue. A safer way to move the screened material into the dumpster is by conveyor.

As shown in Figure 7, the conveyor will be arranged adjacent to the screening discharge locations. The installation will be extended across the emergency channel in case the screens are rearranged, or a third screen is eventually installed in the emergency channel. Screened solids will be conveyed across the pump station to the dumpster continuously, erasing the need for frequent manual transportation of bagged waste. While the conveyor will require some degree of maintenance and additional power, the resulting process is far safer and less time-consuming for the operations team.

3.2 Grit System Improvements

The existing grit removal system consists of a grit basin, grit pump, grit classifier, and grit washer. The overall system is in poor condition with limited remaining service life. Therefore, upgrading this system is ranked as a high priority and should be a component of any facility upgrade alternative in which the existing NSPS would remain in operation (i.e., all alternatives except Alternative 4).

3.2.1 Grit Pump and Piping

The lack of redundancy within the existing grit pumping system is considered high risk for the NSPS from both a reliability and risk-of-failure perspective. The existing pump is nearing the end of its service life. The City has ordered a new pump (wet end only) to replace the existing pump. Depending upon the condition of

the existing pump, the City may elect to rebuild the pump so that it would be a spare pump that could be (quickly) installed, if necessary.

The existing piping is also nearing the end of its service life, which is typically estimated to be 20 years based on the propensity for erosion of the interior pipe wall from the grit slurry moving through the piping. Ninety-degree elbows are especially susceptible to erosion. In the case of the NSPS, a failure of the piping could potentially flood the basement of the station, thus the consequences of failure are very high.

In addition to having a spare pump, a new grit pump could be installed to increase redundancy and improve reliability. The grit piping at the classifier area must be reconfigured to allow installation of the screenings belt conveyor, as such, all grit piping and valves should be replaced with new piping.

3.2.2 Grit Classifier and Washer

The grit classifier and washer, both deemed to be in very poor condition, should be replaced in their entirety, including the associated piping, valves, conduit and wire, and electrical equipment.

3.3 Geodesic Dome Replacement

City staff have reported rapid deterioration of the geodesic dome that covers the pump station. Deterioration has resulted in water leakage through the roof panels, roof panels blowing off during medium- to high-velocity wind gusts, and brittleness of the skylights which have resulted in failures.

The 2021 condition assessment undertaken by Waterdude noted rainwater leakage through the dome (refer to Section 2.3) and recommended full replacement of the dome. BC also noted this deterioration during a subsequent condition assessment inspection and evaluated replacement in more detail with structural assessments and cost estimates.

The structural assessment concluded that the perimeter concrete wall that the dome is anchored to would need to be strengthened to meet current building code requirements. While strengthening the wall could be done in a variety of ways, for the basis of the cost evaluation it was assumed that the wall would be reinforced with concrete buttresses around the exterior of the wall. This increased the estimated cost of the dome replacement to about \$1.6 million (February 2021).

Initially (2021), a second driver for replacing the cover was to simplify pump removal, which-because of design deficiencies in the original design-is difficult to accomplish, labor intensive, and dangerous to personnel. Currently, pump removal is accomplished using a gantry crane/hoist, pallet mover, and forklift to move the pump area in the basement to a flatbed truck outside the building, which is cumbersome and time-consuming. On one occasion, a pump was damaged during the removal process. Replacing the cover offered an opportunity to mitigate damage by adding a dormer with a crane and hoist for safe, proper removal of the wastewater pumps.

However, the structural upgrades to the perimeter wall that would be necessary, combined with escalation due to pushing the project several years into the future, significantly increases the cost of dome replacement. Investing in a new cover for the facility–especially under upgrade alternatives in which the existing facility is ultimately abandoned (Alternatives 1, 2, and 4)–does little towards improving the facility operation. While acknowledging the cover is in poor condition, nonetheless, our recommendation is not to include replacement under any of the upgrade options except Alternative 3.

3.4 Ventilation System Upgrades

The ventilation system for the existing station includes supply and exhaust fans and an activated carbon scrubber. The supply air fans run continuously to maintain a fresh air environment within the station that is essential for personnel to enter the structure.

A condition assessment was completed in 2022 and the fans and fan motors were determined to be in poor condition. The activated carbon scrubber for the exhaust air is not functional and has been abandoned-in-place since 2017. Replacement of the entire system is necessary and included in Alternatives 1, 2, and 3.

3.5 Electrical Upgrades

Based on the testing results and visual observations described in Section 2.3.3, the action items listed below have been incorporated into the overall upgrade recommendations for NSPS.

- 1. Replace the existing power cables for Raw Sewage Pumps No. 1, 2, and 3 with new VFD-rated, multiconductor cable with grounds.
- 2. Replace the existing conductor cables for Rotary Screen No. 1 with new conductors.
- 3. Existing spare conduits between the Electrical Building and the pump station are suitable for use provided each conduit is tested and cleaned prior to pulling new cables into place.
- 4. Install new conduits between the Electrical Building and the pump station for future equipment (i.e., Grit Pump No. 2, Raw Sewage Pump No. 4, Screenings Conveyor, plus any spare conduits). These can be installed in either an overhead configuration or buried. If buried, inspect the existing ductbank for damage when it is exposed for construction of the new conduits.

Programmable Logic Controller (PLC) Replacement: The existing PLC is reaching the end of its service life, as are other PLCs in the City's wastewater facilities. However, replacement parts are difficult to find and procure from vendors. The City has proactively instituted a PLC replacement plan wherein at least one PLC is replaced each year. PLC replacement at NSPS is assumed to fall under this program and therefore has not been included in the CIP for the NSPS.

Section 4: Analysis of Facility Upgrade Alternatives

Four alternatives for upgrading the NSPS have been developed and are described and analyzed in this section. In addition to estimated construction cost, the analysis considers the implementation schedule for each option, which is an important consideration from a cash flow perspective. In addition to investments at the NSPS, the City will also be making improvements to the WWTP and the schedule and cost for those improvements must be considered to match available funds.

The improvements described under these alternatives are in addition to construction of the dechlorination facility (required for NPDES permit compliance as mandated by DEQ) and the site improvements described in Section 2.5.2.

4.1 Upgrade Alternatives

Four alternatives considered for the NSPS upgrades are discussed in this section. The first three alternatives recommend minor to extensive modifications to the existing pump station. Alternative 4 proposes demolition of the pump station. The schedules and costs associated with these alternatives are in the respective sections following.

4.1.1 Alternative 1–"Bare Minimum" Investment

The objective of this alternative is to minimize the capital investment in the existing facility by making minor improvements to extend the life of the facility (Phase I) until a new, buildout facility can be constructed and commissioned (Phase II). After the new facility is in service, the existing station will be decommissioned. Design of the improvements recommended under this alternative would need to begin immediately such that construction of the upgraded facility is completed by 2026.

Improvements to the existing NSPS under this alternative are the highest priority items and related to condition, performance, and operator safety. The improvements listed in Table 4 below are considered the minimum required to increase reliability and to extend service life until the new facility is operational. The new replacement pumping facility would need to be constructed and commissioned by 2031.

	Table 4. Recommended Upgrades for Alternative 1 ("Bare Minimum" Alternative)				
Component	Component Description TM Cross Reference Notes				
Screens	Replace both screens	Section 3.1.4	Emergency bypass channel (Section 3.1.3) and screening conveyor (Section 3.1.5) not included in scope of alternative.		
Ventilation	Ventilation Replace supply and exhaust fans		Carbon scrubber replacement not included in scope of alternative.		
Electrical	 Replace power conductors to pumps and screens Add new conduits for future 	Section 3.5	PLC replacement part of City's overall program.		

4.1.2 Alternative 2–Improvements to Extend Service Life ("10-Year Alternative")

This alternative improves the existing NSPS by replacing and upgrading equipment to increase reliability and extend the service life by ten years. Similar to Alternative 1, a new station (either a dry weather flow facility or a buildout pump station) would need to be constructed at the end of this time frame, but the costs for the new station are pushed further into the future to allow the City to devote funds to WWTP improvements as a higher priority than making investments to the NSPS. Improvements listed in Table 5 below would be made under this alternative.

Table 5. Recommended Upgrades for Alternative 2 ("10-Year Alternative")				
Component	Description	TM Cross Reference	Notes	
	Replace both screens	Section 3.1.4		
Screening	Add screening conveyor	Section 3.1.5		
System	Modify screen channels to add emergency bypass channel	Section 3.1.3	Includes replacing channel isolation plates with actuated slide gates.	
Grit Removal System	Replace basin mechanism, grit pump and piping, grit cyclone, and grit washer	Section 3.2		
Ventilation	Replace supply and exhaust fans	Section 3.4	Carbon scrubber replacement not included in scope of alternative.	
Electrical	Replace power conductors to pumps and screensAdd new conduits for future	Section 3.5	PLC replacement part of City's overall program.	

4.1.3 Alternative 3-New Dry Weather Pump Station with Existing Facility

This alternative entails constructing a new pumping facility on the site but keeping the existing NSPS in operation as well. The new station would function as a "duty" station, operating daily and pumping all influent flow up to its full capacity. The existing station would serve as a wet weather pumping facility. A schematic of the concept is shown in Figure 8.

The capacity of the new duty station would be equivalent to the highest estimated diurnal peak flow that would occur during the dry weather. This sizing criterion would reduce the frequency of placing the second pump station (the existing NSPS) in operation during the dry weather season. The existing NSPS would be upgraded and re-purposed as a peak flow facility and would also be capable of serving as a standby facility

that would be placed into operation whenever influent flows exceed the capacity of the duty station or in the event the duty station is out of service.

Figure 8. Flow Schematic for Separate Dry Weather and Wet Weather Pump Stations

Although this alternative was fully developed and evaluated, it was eliminated as a viable option based on total cost and the need to maintain two separate pumping facilities, whereas each of the other alternatives consists of a single pump station. In addition to this alternative having the highest estimated capital cost, operation and maintenance costs would also be higher than any of the other alternatives because there would be two stations to operate and maintain rather than just a single station.

4.1.4 Alternative 4–Construct New Buildout Facility without Existing Facility

In this alternative, a new pumping facility would be constructed and the existing NSPS would be decommissioned. The new station would be designed as a state-of-the-art facility, meeting all current codes and standards of practice such as:

- Hydraulic Institute [HI] standards for pumping stations
- Building codes
- Structural codes (Oregon Structural Specialty Code [OSSC])
- Safety guidelines and requirements of the Occupational Health and Safety Administration (OHSA)
- Fire and life safety codes mandated by the National Fire Protection Association (NFPA)
- Electrical codes by the National Electric Code (NEC).

Under this alternative, the City would not make further investments in the existing NSPS. Instead, design of the buildout facility would begin immediately, and the new station would be constructed as quickly as possible to minimize the length of time the existing NSPS would remain in service in its current condition.

A schematic of the buildout facility is shown in Figure 9 and the components of the new facility are listed in Table 6.

Pig launch station	Spare parts storage area		

Brown AND Caldwell

4.2 Implementation Schedules

Each alternative has a unique implementation schedule as shown below in Figure 10. Due to the poor condition of the existing NSPS, all alternatives would start as soon as the City has established funding for the selected project.

Alternatives 1 and 2 require follow-on projects; these would occur after the initial upgrades have been completed to improve station reliability. Conversely, Alternatives 3 and 4 are standalone projects since these alternatives entail constructing a new pumping facility.

The gap between the two phases is designed to allow the City to shift focus to the WWTP and make upgrade investments at that facility while managing and stretching funding requirements.

4.3 Cost Evaluations

The Association for the Advancement of Cost Engineering (AACE) International Class 4 level capital cost estimates have been prepared for each alternative. These are summarized in Table 7. Costs shown in Table 7 have been escalated to the approximate mid-point of construction according to the implementation schedules shown in Figure 10. Costs include a 40-percent contingency to cover unforeseen conditions and to account for unknown items that arise as the design is developed.

Table 7. Estimated Construction Costs for Northside Pump Station Alternatives				
Alternative	Description	Construction Mid-Point	Estimated Cost (Million)	
	Bare Minimum			
1	Initial Upgrade to Existing Station	2025	\$3.1	
	New Buildout Station	2031	\$27.9	
	Total, Alternative 1		\$31.0	
	10-Year Extension			
2	Initial Upgrade to Existing Station	2026	\$5.0	
	New Buildout Station	2036	\$33.9	
	Total, Alternative 2		\$38.9	
3	New Dry Weather Station	2028	\$27.9	
4	New Buildout Station	2027	\$22.9	

The cost for the dechlorination facility project, which includes a limited amount of site improvements (e.g., pavement, etc.) and demolition of existing structures on the site, is not included in the alternative costs since this will be an independent, standalone project that the City will undertake for DEQ compliance.

Replacement of the geodesic dome is not included as part of any alternative that keeps the existing station in service (i.e., Alternatives 1, 2, and 3). Engineering costs for design and construction phase services are also not included. A detailed breakdown of costs is provided in Attachment A.

Section 5: Recommended Improvement Plan

Alternatives were presented to City staff at meetings in March and April 2023 for discussion and input. Alternative 3, as stated earlier, was eliminated due the cost of implementation and need to maintain two facilities rather than just a single pumping station.

Alternative 2 was selected as the preferred alternative for several reasons. Although the total cost of this alternative is the highest of the three remaining alternatives, making a relatively small initial investment to increase station reliability fully utilizes the remaining service life of the station. By the time the buildout station is completed and operational, the existing NSPS will have reached the end of its reasonable service life.

Secondly, the gap between the initial upgrade project and the ultimate facility fits well into the overall CIP, allowing the City to spread the costs of the NSPS and WWTP upgrades over a reasonable time frame. The City will need to spend substantial funds on the WWTP improvements. If construction at NSPS overlaps with that work, funding both projects together may present an undesirable financial situation for the City. Therefore, Alternative 2 provides the City with a longer "window" to postpone costs for design and construction of the replacement buildout station until after the WWTP upgrades have been completed.

As a result, the CIP developed for the WWTMP has been based on implementation of Alternative 2.

Subject:	Solids Stream Basis of Design Newport WWT Master Plan – Phase II, Brown & Caldwell Project No. 158211 City of Newport K/J Project No. 2276008*00

Introduction

The City of Newport (City) owns and operates the Vance Avery Wastewater Treatment Plant (WWTP) constructed in 2002 and located in South Beach, Oregon. The WWTP is an activated sludge plant with a peak wet weather capacity of 15 million gallons per day (mgd) that currently receives an average annual flow of approximately 2 mgd. In 2022, the City authorized Brown & Caldwell (BC) to perform master planning for the WWTP. BC has subcontracted with Kennedy/Jenks Consultants (Kennedy Jenks) in an agreement dated 11 March 2022 to complete a Biosolids Alternatives Evaluation for the solids stream at the WWTP. The evaluation will assess biosolids management alternatives to provide a long-term biosolids handling, treatment, and beneficial use or disposal portfolio for the City's WWTP operations. Recommendations from the evaluation will account for hauled waste at the WWTP, solids stabilization and storage, dewatering, Class A and/or B treatment technologies, beneficial use, and compliance with Oregon Department of Environmental Quality's (DEQ) biosolids regulations. Regulatory trends will be incorporated in order to project compliance requirements into the planning horizon. The information from the evaluation will be incorporated by BC and the City into the Newport Wastewater Treatment Master Plan.

The purpose of this Technical Memorandum (TM) is to develop Basis of Design criteria for preliminary sizing of solids treatment processes that will be considered in the Biosolids Alternatives Evaluation. Basis of Design criteria include solids flows and loads, wasting schedules and solids characteristics such as percent total solids (TS), Total Suspended Solids (TSS) and Volatile Suspended Solids (VSS) content. This TM presents Basis of Design criteria for a 20-year design period.

Existing Conditions

The current solids process at the WWTP includes pumping waste activated sludge (WAS) to an aerobic tank for storage and thickening, dewatering using centrifuges, and stabilization of the

Josh Johnson, Brown & Caldwell 22 August 2022 BC Project No. 158211 Page 2

biosolids using RDP Technologies' lime pasteurization system, resulting in a Class A Exceptional Quality (EQ) biosolids product. The WWTP process flow diagram is shown on Figure 1.

Figure 1: Current Process Flow Diagram

Solids Stream Design Criteria

Kennedy Jenks, with assistance from the City and BC, has developed the Basis of Design criteria presented in this section. The Basis of Design criteria are needed for the preliminary sizing of solids stream processes and are based on plant operational data and future flows and loads. Wastewater treatment plant flows and loads, as well as solids stream projected loadings, were developed by BC and are presented in Tables 1 and 2, respectively. Design criteria for solids stream unit processes that may be considered as part of the Biosolids Alternatives Evaluation are summarized below and presented in Tables 3 through 8.

 <u>Hauled Waste</u> – a packaged system to receive septage and other hauled waste will be included with each biosolids alternative. The packaged system described is based on a Huber RoFas system, which in Kennedy Jenks' research has not shown to be prone to ragging, and includes an integral grit removal process. The packaged system is available with or without a ticketing system for tracking hauled waste loads and is used in other wastewater facilities in Oregon.

Josh Johnson, Brown & Caldwell 22 August 2022 BC Project No. 158211 Page 3

- <u>Solids Storage</u> the existing sludge storage tank will be assumed to continue to receive WAS and hauled waste, similar to current WWTP operations. The ability of the tank to thicken solids to a desirable solids concentration for dewatering will impact biosolids alternatives that do not include thickening and stabilization unit processes, such as aerobic or anaerobic digestion. Either additional storage volume or a lower dewatering feed solids concentration may be considered for these alternatives.
- <u>Thickening</u> a mechanical thickening process may be considered for biosolids alternatives that include a stabilization unit process, such as aerobic or anaerobic digestion. Thickening facilities would receive flow from the sludge storage tank at 0.5 to 0.7% TS and produce 4 to 5% TS thickened solids product.
- <u>Solids Stabilization</u> biosolids alternatives will be developed both with and without stabilization to understand the costs and benefits of aerobic or anaerobic digestion to reduce the overall mass of biosolids for further treatment and disposal.
- <u>**Dewatering**</u> dewatering of biosolids, whether following stabilization or directly from the sludge storage tank, will be evaluated. Dewatered biosolids will consist of a 20% TS cake that will be conveyed to further treatment to produce Class A or B biosolids.
- <u>Class A Biosolids Treatment</u> processes such as composting and mechanical dryers will be evaluated for the production of Class A biosolids in comparison to the existing RDP lime pasteurization process. These processes will result in a finished biosolids product that can be beneficially applied to agricultural lands, or sold or given away to the general public as a soil amendment.

Volume, gallons	360,000		
Performance			
HRT, Days ^(c)	3.1		
Decant, gpd	59,000		
Decant %TS ^(d)	0.11		
Decant Solids Load, ppd	546		

Notes:

(a) Assumes existing Sludge Storage Tank is maintained.

(b) ft = feet.

(c) HRT = hydraulic retention time, at maximum week WAS and hauled waste loading.

(d) Based on WWTP operating data provided by BC via email dated 28 April 2022.

The decant rate assumes the sludge holding tank is decanted on a daily basis at a rate of 50% of tank influent flow to produce a thickened solids concentration of 1% to dewatering. Discussions with WWTP operations staff indicate the capacity to effectively decant the holding tank is limited to 20% of the tank influent flow. The Biosolids Evaluation Report will need to consider increasing the storage tank volume to produce a thickened solids concentration of 1%. Alternatively, the Biosolids Evaluation Report may consider lower decant rates that produce a thickened solids concentration of 0.6 to 0.7% TS, similar to current WWTP operations.

Mechanical thickening is recommended for alternatives considering solids stabilization, ie aerobic or anaerobic digestion. Mechanical thickening design criteria are summarized in Table 5.

(c) Typical range for aerobically digested sludge is 18 to 22%.

(d) Typical range for anaerobically digested sludge is 20 to 25%.

(e) Based on sludge testing performed by Andritz, dated 2 June 2022.

Table 8: Class A Biosolids Treatment Design Criteria

Parameter	Value
Biosolids Treatment	
Design Condition	Max Month
Redundancy	No Standby
Location	Onsite
Compost	
Bulking Agent:Solids Loading Ratio ^(a)	1.2:1
Time Requirement, weeks	6-7
Area Requirements	
Bulking Agent, ft ² per Ib ^(b,c)	2-3
Treatment, ft ² per lb ^(b,d)	3
Finished Product Storage, ft^2 per $Ib^{(b,e,f)}$	3
Finished Product Volume, ft ³ per lb ^(b,g)	0.25
Drying	
Fuel Source	Natural Gas
Temperature ^(h)	212 to 400°F
Product Solids Concentration, %TS	> 90%

Josh Johnson, Brown & Caldwell 22 August 2022 BC Project No. 158211 Page 9

Parameter	Value
Finished Product Storage	Super Sacks
Lime Heat Pasteurization	
Lime:Solids Loading Ratio ⁽ⁱ⁾	0.4
Time Requirement, minutes	30
Temperature Requirement	> 158°F
pH Requirement	12 or higher

Notes:

(a) Wet lbs basis.

(b) Lbs dewatered solids, dry basis.

(c) Assumes 90 days storage, 12' high (H) piles.

(d) Assumes 8'H piles.

(e) Assumes 90 days storage, 8'H piles.

(f) Assumes conservative mass reduction of 10%.

(g) Assumes typical mass reduction of 25%.

(h) Varies with technology (e.g. indirect dryers, direct dryers, belt dryers).

(i) Dry lbs basis from typical design criteria for existing RDP system.

Thank you for your interest in HUBER Technology, Inc. If you have any questions, please do not hesitate to contact our Regional Sales Director or our local sales representative.

This proposal has been reviewed for accuracy and approved for issue by: JW

Notes and Technical Clarifications

- 1. Equipment specification and drawings are available upon request.
- 2. If there are site-specific hydraulic constraints that must be applied, please consult the manufacturer's representative to ensure compatibility with the proposed system.
- 3. Electrical motor disconnects required per local NEC code are not included in this proposal.
- 4. All electrical interconnections, motor disconnects, wirings, junction boxes, and terminations between the equipment and electrical components are to be provided by installing contractor.
- 5. HUBER Technology warrants all components of the system against faulty workmanship and materials for a period of 12 months from date of start-up or 18 months after shipment, whichever occurs first.
- 6. Budget estimate is based on Huber Technology's standard Terms & Conditions and is quoted in US dollars unless otherwise stated.
- 7. Equipment recommendations are based on information provided to Huber Technology. Subsequent information which differs from what has been provided may alter the equipment recommendation.
- 8. Any item not specifically listed is not considered part of this scope of supply. Please contact the HUBER Technology representative listed for further clarification.
- 9. HUBER will ship all equipment to site inside of 20', 40' or 40'OT ocean containers as deemed appropriate by our factory. HUBER will not ship any equipment on flatbed truck. Flatbed truck shipping means that the equipment would need to be transferred at port from factory packaged containers to the flatbed. This process it out of HUBER's control and it is our experience that equipment always gets damaged during this process.
- 10. Equipment that is broken out in "Pricing" tab are only valid when packaged together.
- 11. All piping to and from the equipment is to be supplied by the installing contractor.
- 12. Please note the pH sensor can be tied into our standard equipment panel, where the pH level can be displayed on the HMI for operator or SCADA use.

Re: FKC Co., Ltd. Quotation QT04-052423RW Newport OR WWTP – FKC Thickening Equipment

Victor:

FKC is pleased to provide this proposal for thickening of Waste Activated Sludge at the Newport, OR WWTP. This proposal includes:

- (2) Two FKC Model RST-S630x2000L Rotary Screen Thickener (RST) with Support Frame
- (2) Two Discharge Hopper w/ custom connection to TWAS Pump
- (2) Two FKC Model 150GL Flocculation Tank with Agitator Assembly
- (2) One 1.5-inch Solenoid Valve
- (2) VeloBlend Liquid Polymer Blending Systems
- All Required spare parts/All required start-up services
- All Required training and performance testing

All items listed are shipped separate and loose to be assembled/installed by others.

Please note that the pricing found in this quote does not include all the other equipment necessary for a complete thickening application; i.e. feed pump, thickened sludge pump, local control panel, field instrumentation, etc.

We hope this information is helpful. Please contact this office if you have questions, or if you need anything further.

Sincerely, FKC Co., Ltd.

Ryan Whitmore

A. Proposed Equipment

<u>Qty.</u>	Description	FOB Newport OR WWTP
2	FKC Rotary Screen Thickener Model RST-S630x2000L	See Price Summary Paragraph B.3.
	Material:	100% Municipal WAS
	Inlet Capacity:	Up to 100 gpm
	Inlet consistency:	0.5% TS or Higher
	Polymer Dose:	Not to exceed 10 lbs active polymer per ton dry solids
	Outlet consistency:	4% TS or Higher - Aerobically Digested 5% TS or Higher – Anaerobically Digested (lab sample required to guarantee results)
	Solids Capture Rate	95%
	Materials of construction:	SS-304L wetted parts SS-304L Base SS-304L Support Legs & Frame Other Painted Carbon Steel
	Speed reducer:	SEW Eurodrive Gearbox Motor: 1.5 HP 480V/3PH/60Hz
	Other:	Two (2) 150GL Flocculation Tank SEW Eurodrive Gearbox Motor: 1 HP 480V/3PH/60Hz
	-	

Delivery:

Delivery within seven (8) months after notice to proceed with manufacturing.

*Prices do not include taxes or bonding requirements

B. <u>Miscellaneous</u>

1. Delivery

On-site delivery will be within eight (8) months after notice to proceed with manufacturing.

2. Shipping Arrangements

The FKC thickening equipment will be shipped best way overland from Port Angeles, Washington to Newport, OR.

3. Equipment Summary

The following summarizes the equipment offered:

- (2) Two FKC Model RST-S630x2000L Rotary Screen Thickener (RST) with Support Frame
- (2) Two Custom Discharge Hopper w/ connection to TWAS Pump
- (2) Two FKC Model 150GL Flocculation Tank with Agitator Assembly
- (2) Two 1.5-inch Slow-Closing Solenoid Valve

US\$ 181,100 FOB Newport OR WWTP

Optional Polymer Blending System Adder:

(2) Two VeloBlend Liquid Polymer Blending System

US\$ 61,300 FOB Newport OR WWTP

This quotation and pricing does not include taxes or bonding.

Please note that the pricing found in this quote does not include all the other equipment necessary for a complete thickening application; i.e. polymer system, feed pump, TWAS pump, control panel, field instrumentation, etc.

4. Options Offered

No Options are offered at this time.

5. Effective Period

This proposal shall remain valid 60 days from the date of the proposal.

6. Payment Terms

10% with submittal approval 90% with delivery Net 30 days

FKC understands that with some contract requirements, up to 10% of each milestone payment may be retained until successful performance is demonstrated.

7. Installation

The Rotary Screen Thickener is shipped ready for installation.

The Flocculation Tank is shipped ready for installation. Field assembly of the agitator drive, base and blades are required.

The Solenoid Valve is shipped loose for field installation by others.

8. Operator Training and Start Up

One (1) trips, three (3) person-days are provided for on-site services including start-up, performance testing and training of the Rotary Screen Thickener and Flocculation Tank.

Other installation and erection assistance are not included in the price of the equipment and generally are not required. However, the service is available for our standard service rates (see the enclosed rate sheet).

9. Warranty

FKC's mechanical warranty covers material and workmanship for a period of twelve (12) months from start-up or eighteen (18) months from delivery whichever occurs first.

10. Documentation Schedule

The drawings provided with this scope of supply are reference drawings only.

- A. Approval Drawings within 3 weeks after receipt of purchase order Buyer must return approval drawings within 14 days or delivery schedule will be affected
- B. Certified Drawings within 2 weeks after return of approval drawings
- C. Operation and Maintenance Manuals 14-16 weeks after receipt of order

11. Performance Guarantee

The performance figures and conditions denoted in section A of this proposal constitute FKC Co., Ltd.'s performance guarantee and the conditions required to meet the guarantee. All of the consistency figures are based on total solids (TS) not total suspended solids (TSS).

If performance is not met, FKC will provide all parts, engineering, and labor associated with the work necessary to bring the equipment into conformance with the performance guarantee.

12. Notes and Clarifications

No notes or clarification are offered at this time.

13. Spare Parts List

No spare parts are required for the first 1-2 years of operation. A list of long-term spares in available upon request.

14. Service Rates

The following are rates and terms for professional and technical services furnished by FKC: If required, round-trip airfare (coach class) from Port Angeles, WA to airport nearest work site.

<u>Weekdays</u>

\$1,200.00 - Per eight (8) hour day on weekdays plus, lodging, and rental car expenses. \$225.00 - Per hour for all hours exceeding eight (8) hour workday on weekdays.

Saturdays, Sundays and Holidays

\$1,800.00 - Per eight (8) hour day plus lodging and rental car expenses. \$350.00 - Per hour for all hours exceeding eight (8) hour workday.

Travel Time - Weekdays

\$80.00 - Per hour travel time. (Not to exceed \$990/day)

Travel Time – Weekends and US Holidays

\$120.00 - Per hour travel time (Not to exceed \$1,440/day)

Good Evening Ben,

Please see below for conveyor budget pricing from Serpentix. Keep me posted as you start to get into the design details.

CONVEYOR-A (forward running only - south direction): ~\$87,650 USD

- * complete mechanical Model-P2 conveyor, with fully assembled 2HP drive station and tension station
- * pre-assembled chain in 401 link sections; 26in belting assembled in 4'-0" sections from factory
- * track 304 stainless steel construction
- * zero speed sensor (120VAC | 1ph), emergency pull-cord switches (120VAC | 1ph)
- * solenoid oiler bottle (120VAC | 1ph) for track lubrication
- * skirtboards (at loading area) 3/8" HDPE w/ 304SS brackets
- * drip pans 16ga galvanized sheet w/ 304SS brackets
- * supports ASTM A572 Grade-50, hot-dipped galvanized construction
- * assembly hardware 304SS standard
- * one (1x) trip for one (1x) day of equipment start-up certification and O&M training

* Serpentix's standard NEMA 4X control panel for forward operation direction; includes motor starter, control relay logic, operator indicators / switches, run permissive for AUTO mode, select-able HAND mode

* warranty - One (1x) year warranty from equipment start-up, that covers against defects in materials and workmanship; does not include failures caused by abuse, negligence or lack of preventative maintenance. Parts only supplied by Serpentix if warranty claim is validated - time / labor of removal and installation is the responsibility of the Owner. * freight to the jobsite

CONVEYOR-B (forward running only - west direction): ~\$129,385 USD

- * complete mechanical Model-P2 conveyor, with fully assembled 3HP drive station and tension station
- * pre-assembled chain in 401 link sections; 26in belting assembled in 4'-0" sections from factory
- * track 304 stainless steel construction
- * zero speed sensor (120VAC | 1ph), emergency pull-cord switches (120VAC | 1ph)
- * solenoid oiler bottle (120VAC | 1ph) for track lubrication
- * skirtboards (at loading area) 3/8" HDPE w/ 304SS brackets
- * drip pans 16ga galvanized sheet w/ 304SS brackets
- * supports ASTM A572 Grade-50, hot-dipped galvanized construction
- * assembly hardware 304SS standard

* one (1x) trip for one (1x) day of equipment start-up certification and O&M training

* Serpentix's standard NEMA 4X control panel for forward operation direction; includes motor starter, control relay logic, operator indicators / switches, run permissive for AUTO mode, select-able HAND mode

* warranty - One (1x) year warranty from equipment start-up, that covers against defects in materials and workmanship; does not include failures caused by abuse, negligence or lack of preventative maintenance. Parts only supplied by Serpentix if warranty claim is validated - time / labor of removal and installation is the responsibility of the Owner. * freight to the jobsite

CONVEYOR-C (both forward & reverse operation - north/south direction): ~\$43,520 USD

* complete mechanical Model-FD conveyor; with fully assembled 2HP drive station and tension station

- * Model-FD track 304 stainless steel; 24" width low-profile
- * open flange discharges at either end of conveyor (no knife gates)
- * assembly hardware 304SS
- * suspended supports A572 Grade-50 steel, hot-dipped galvanized
- * one (1x) trip for one (1x) day of equipment start-up certification and O&M training
- * Serpentix's NEMA 4X main control panel (MCP) for forward & reverse operation direction; includes REVERSING

CONTACT motor starter, control relay logic, operator indicators / switches, run permissive for AUTO mode.

* Serpentix's NEMA 4X local control station (LCS) for select-able HAND mode [HOA switch], & selector switches for knife gates

* warranty - One (1x) year warranty from equipment start-up, that covers against defects in materials and workmanship; does not include failures caused by abuse, negligence or lack of preventative maintenance. Parts only supplied by Serpentix if warranty claim is validated - time / labor of removal and installation is the responsibility of the Owner. * freight to the jobsite

NOTE: Excluded from the budget pricing:

- * anchors / anchorage (typically contractor's responsibility)
- * cross mounting beam / building beams / foundation design, if applicable (structural engineer's responsibility)
- * structural design calculations, and PE stamping

Thanks,

×

Number of unit:	1
Model:	LT 420
Dimensions (HxWxL):	12 x 10.5 x 45 ft for one dryer
Clearance Requirement:	4 ft
Heat Source:	Hot water loop

ITEM 3. SCOPE OF SUPPLY

DI T 420.

- 1. One low temperature belt dryer
- 2. One sludge feed cake pump
- 3. Controls in non-classified environment
- 4. In unit feed and distribution system
- 5. In unit heat recovery system
- 6. Start-up assistance
- 7. Freight

ITEM 4. Dryer Operation and Maintenance Requirement

- 1. Check feedline pressure, belt tension and temperature on the control panel monitor; take dried sludge sample (once per shift)
- 2. Clean the matrix of sludge feeding system and sensors (once per a week)
- 3. Inspect and adjust the sludge feeder system and clean belt (once per a month)
- 4. Grease bearing and chains (once every 3 months)
- 5. Clean sludge build up inside the dryer and on the heat exchanger (once a year)

ITEM 5. ANCILLARY PROCESS (NOT INCLUDED IN SOP AND PROPOSED PRICE)

- 1. Odor control system (i.e. biofilter or chemical scrubbers) and exhaust system
- 2. Heat distribution system (i.e. Hot water loop consist of CHP, boiler, primary and secondary circulation pumps, expansion tanks, heat rejection unit) to provide hot water (194F) to each dryer at the normal operational condition

ITEM 6. PURCHASE PRICE:

Aerobic 24/5: One (1) DLT220 Unit	\$1,700,500 USD
Anaerobic 24/5: One (1) DLT220 Unit	\$ <u>1,700,500</u> USD
Anaerobic 16/4: One (1) DLT320 Unit	\$ <u>1,883,300</u> USD
Aerobic 16/4: One (1) DLT420 Unit	\$ <u>2,083,000</u> USD

F.O.B. Jobsite, freight included, taxes excluded.

VALIDITY:

Purchase Price is valid for sixty (60) calendar days from Quotation date, for shipment of Equipment within the timetable stated below in ITEM 6.

PAYMENT TERMS:

30% with order; 60% upon shipment; 10% after startup not to exceed 90 days after shipment.

ITEM 7. <u>TIMETABLE</u>

Submittal phase:	8-10 weeks after the order receipt
Approval phase:	4 weeks for the customer to approve the drawings
Shipment phase:	50-60 weeks following receipt of the Approval drawings

Dates are subject to confirmation upon receipt of written Purchase Order.

ITEM 8. WARRANTY

One (1) year from the equipment start up or eighteen (18) months from delivery.

ITEM 9. START UP ASSISTANCE

Centrisys will furnish factory representatives for 20 days over 5 weeks to assist in installation inspection, start-up supervision, and operator training. Dates of service to be scheduled upon Buyer's written request.

ITEM 10. BUYER/OWNER RESPONSIBILITY OR NOT INCLUDED AT THIS TIME:

- Engineering support or site visit stated otherwise
- Wiring and conduit for control panel
- Dewatered cake feed pump/conveyor
- Material conveyance to, from and between equipment
- Odor control, exhaust ducting, fan and stack.
- Heat distribution system
- All utilities that are required for operation
- Unloading, uncrating, installation and installation supervision.
- Temporary dryer installation.
- Readiness of the Equipment before requesting start-up service. Non-readiness may incur additional charges.
- Compatibility of Equipment materials of construction with process environment.
- Piping connections, platforms, gratings and railings unless stated otherwise
- Bonding for the equipment
- Any other auxiliary equipment or service not detailed above.
